

Features

- Fast Access Time: 30/35/40/45ns
- Fast EDO Page Cycle Time: 13.3/15/16/18ns
- EDO Page Mode Operation
- Single +5V \pm 10% Power Supply
- Low Power Dissipation
- Individual Byte Control via Dual CAS Inputs
- Three Refresh Modes
- 512-Cycle Refresh in 8ms(9 rows and 9 columns)
- TTL Compatible
- 40-Pin, 400-mil Plastic SOJ Package, or 40/44-Pin, 400-mil Plastic TSOP-II Package.

Overview

The Em614163A-30/35/40/45 is a high speed EDO(Extended Data Output) DRAM organized in 262,144 words by 16 bits. It supports EDO Page Mode and 16-bit data width for high data bandwidth applications. The EDO Page Mode is an accelerated access that provides a shorter page cycle and a faster data access time than the traditional Fast Page Mode.

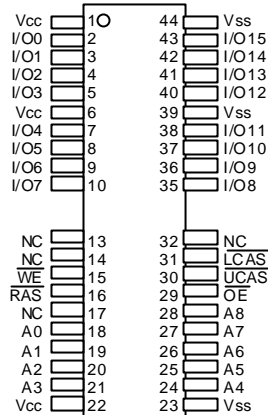

Compared with Fast Page Mode DRAM, the EDO DRAM data output will be held valid after $\overline{\text{CAS}}$ goes HIGH, as long as RAS and $\overline{\text{OE}}$ are held LOW and $\overline{\text{WE}}$ is held HIGH. This feature allows $\overline{\text{CAS}}$

Pin Assignment (Top View)

40-Pin SOJ

40/44-Pin TSOP-II

Pin Names

A0 - A8	Address Inputs
RAS	Row Address Strobe
UCAS	Column Address Strobe (Upper Byte Control)
LCAS	Column Address Strobe (Lower Byte Control)
WE	Write Enable
OE	Output Enable
I/O0 - I/O15	Data Input/Output
Vcc	+5V Power Supply
Vss	Ground
NC	No Connection

precharge time to occur without the output data going invalid. Therefore, the EDO CAS timing can be condensed to carry more data out in a given period.

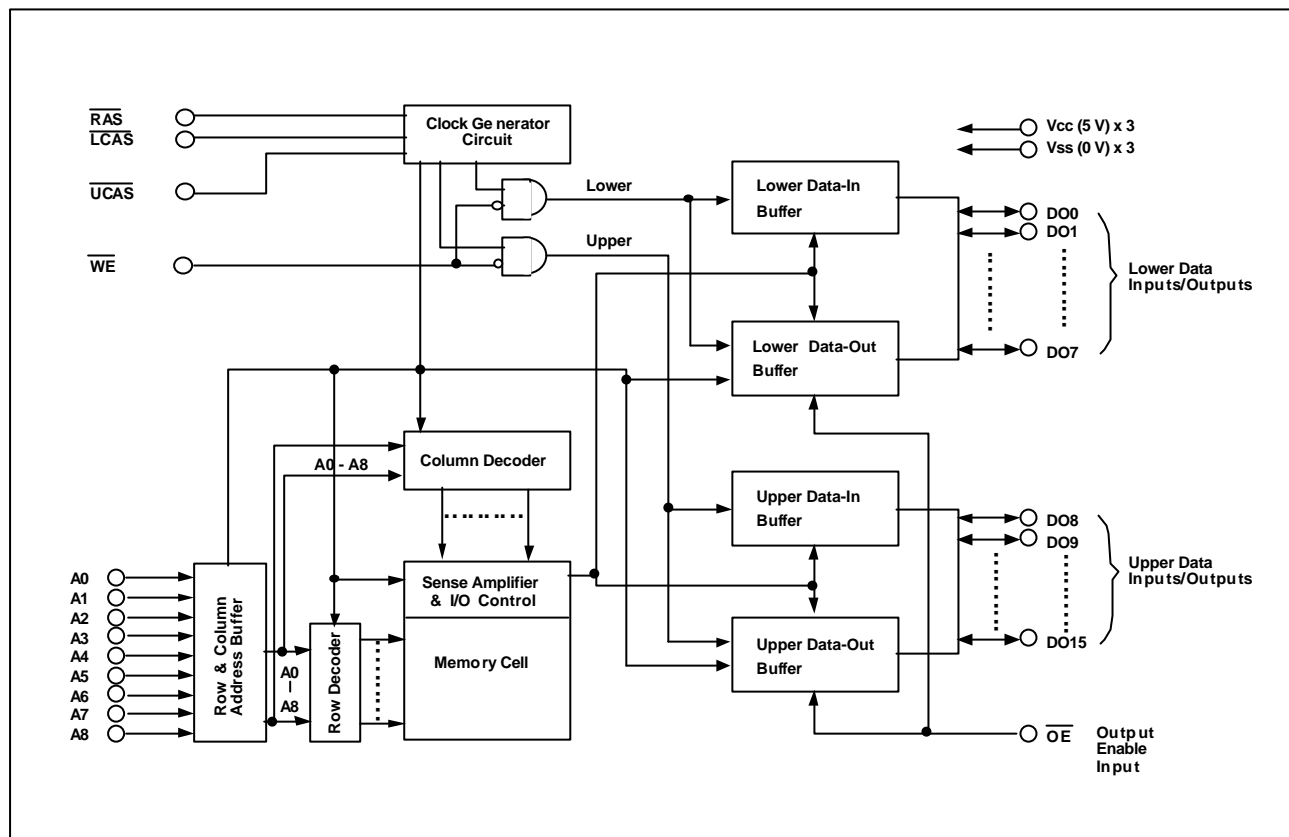

The Em614163A-30/35/40/45 fully utilizes the EDO Page Mode advantages. It allows 512 random access within a page with a fast cycle time as short as 13.3/15/16/18 ns.

The Em614163A-30/35/40/45 is ideally suitable for high performance graphics frame buffers, CD-ROMs, disk drivers, set top boxes, and DSP applications.

Notes:

1. These WRITE cycles may also be BYTE WRITE cycles (either $\overline{\text{LCAS}}$ or $\overline{\text{UCAS}}$ active).
2. These READ cycles may also be BYTE READ cycles (either $\overline{\text{LCAS}}$ or $\overline{\text{UCAS}}$ active).
3. EARLY WRITE only.

4. At least one of the two $\overline{\text{CAS}}$ signals must be active (LCAS or UCAS).

Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Supply voltage	V _{SS}	0	0	0	V	2
	V _{CC}	4.5	5.0	5.5	V	1, 2
Input high voltage	V _{IH}	2.4	\bar{i} \bar{D}	V _{CC} + 0.3	V	1
Input low voltage	V _{IL}	- 0.5	\bar{i} \bar{D}	0.8	V	1, 3

Notes:

1. All voltage referenced to V_{SS}.
2. The supply voltage with all V_{CC} pins must be the same level.
The supply voltage with all V_{SS} pins must be the same level.
3. V_{IL}(min.) = - 1.2V for pulse width \bar{i} \bar{D} 30ns.

DC Characteristics

T_A = 0 to +70°C; V_{CC} = +5V ± 10%, V_{SS} = 0V

Parameter	Symbol	Test Conditions	Em614163A		Unit	Notes
			-30/35/40/45			
			Min	Max		
Operating current	I _{CC1}	$\overline{\text{RAS}}$ cycling $\overline{\text{LCAS}}$, $\overline{\text{UCAS}}$ cycling trc = min.	\bar{i} \bar{D}	280/250/225/200	mA	1, 2
Standby current	I _{CC2}	$\overline{\text{RAS}}$, $\overline{\text{LCAS}}$, $\overline{\text{UCAS}}$ = V _{IH} Dout = High-Z	\bar{i} \bar{D}	2	mA	
		$\overline{\text{RAS}}$, $\overline{\text{LCAS}}$, $\overline{\text{UCAS}}$, OE = V _{CC} - 0.2V Dout = High-Z	\bar{i} \bar{D}	1	mA	
RAS-only refresh current	I _{CC3}	$\overline{\text{RAS}}$ cycling, $\overline{\text{CAS}}$ = V _{IH} trc = min.	\bar{i} \bar{D}	280/250/225/200	mA	2
Standby current	I _{CC5}	$\overline{\text{RAS}}$ = V _{IH} $\overline{\text{LCAS}}$, $\overline{\text{UCAS}}$ = V _{IL} Dout = enable	\bar{i} \bar{D}	5	mA	1

Fast page mode current	I _{CC7}	tpc = min.	\bar{i} \bar{D}	280/250/225/200	mA	1, 2
Input leakage current	I _{LI}	0V _i \bar{O} V _{in_i} \bar{O} V _{CC}	-10	10	μA	
Output leakage current	I _{LO}	0V _i \bar{O} V _{out_i} \bar{O} V _{CC} Dout = Disable	-10	10	μA	
Output high voltage	V _{OH}	I _{OH} = - 2.5 mA	2.4		V	
Output low voltage	V _{OL}	I _{OL} = + 2.1 mA		0.4	V	

Notes:

1. I_{CC} depends on output load condition when the device is selected. I_{CC}-max is specified at the output open condition.
2. Address can be changed once or less while $\overline{\text{RAS}}$ = V_{IL}.
3. Address can be changed once or less while $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$ = V_{IL}.
4. All the V_{CC} pins shall be supplied with the same voltage. And all the V_{SS} pins shall be supplied with the same voltage.

AC Characteristics (2, 3, 4, 5)

($T_a = 0$ to $+70^\circ\text{C}$; $V_{cc} = 5\text{V}$; $\pm 10\%$, $V_{ss} = 0\text{V}$)

Test Conditions

- Input rise and fall times: 2ns
- AC test condition, input pulse levels 0V to 3V
- Output load: 1 TTL loads and 50pF
- Output timing reference levels: $V_{OH} = 2.0\text{V}$
 $V_{OL} = 0.8\text{V}$

Counter Test Cycle

$\overline{U/LCAS}$ precharge time in counter test cycle	tcPT	30	i Ⓢ	ns	23
--	------	----	-----	----	----

Notes:

1. Assume $t_T = 2\text{ns}$.
2. An initial pause of 100 μs is required after power up followed by a minimum of eight initialization cycles ($\overline{\text{RAS}}$ -only refresh cycle or $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle). If the internal refresh counter is used, a minimum of eight $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycles are required.
3. In delayed write or read-modify-write cycles, $\overline{\text{OE}}$ must disable output buffer prior to applying data to the device.
4. When both $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$ go low at the same time, all 16-bits data are written into the device. $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$ cannot be straggled within the same write/read cycles.
5. All the V_{CC} and all the V_{SS} pins shall be supplied with the same voltages.
6. $t_{\text{RAS}}(\text{min}) = t_{\text{RWD}}(\text{min}) + t_{\text{RWL}}(\text{min}) + t_T$ in read-modify-write cycle.
7. $t_{\text{CAS}}(\text{min}) = t_{\text{CWD}}(\text{min}) + t_{\text{CWL}}(\text{min}) + t_T$ in read-modify-write cycle.
8. t_{ASC} , t_{CAH} , t_{RCS} , t_{CSR} , t_{WCS} , t_{WCH} , and t_{RPC} are determined by the earlier falling edge of $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$.
9. Operation with the $t_{\text{RCD}}(\text{max})$ limit insures that $t_{\text{RAC}}(\text{max})$ can be met. $t_{\text{RCD}}(\text{max})$ is specified as a reference point only: If t_{RCD} is greater than the specified $t_{\text{RCD}}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .
10. Operation with the $t_{\text{RAD}}(\text{max})$ limit insures that $t_{\text{RAC}}(\text{max})$ can be met. $t_{\text{RAD}}(\text{max})$ is specified as a reference point only: If t_{RAD} is greater than the specified $t_{\text{RAD}}(\text{max})$ limit, then access time is controlled exclusively by t_{AA} .
11. t_{CRP} , t_{CHR} , t_{RCH} , t_{CPA} and t_{CPW} are determined by the later rising edge of $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$.
12. $V_{\text{IH}}(\text{min})$ and $V_{\text{IL}}(\text{max})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
13. Assumes that $t_{\text{RCD}}; \emptyset t_{\text{RCD}}(\text{max})$ and $t_{\text{RAD}}; \emptyset t_{\text{RAD}}(\text{max})$. If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
14. Assumes that $t_{\text{RCD}}; \emptyset t_{\text{RCD}}(\text{max})$ and $t_{\text{RAD}}; \emptyset t_{\text{RAD}}(\text{max})$.
15. Access time is determined by the longer of t_{AA} or t_{CAC} or t_{CPA} .
16. t_{CAC} is guaranteed for one TTL and 50pF load.
17. Assumes that $t_{\text{RCD}}; \emptyset t_{\text{RCD}}(\text{max})$ and $t_{\text{RAD}}; \emptyset t_{\text{RAD}}(\text{max})$.
18. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
19. $t_{\text{OFF}}(\text{max})$ and $t_{\text{OEZ}}(\text{max})$ define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels. The t_{OFF} is determined by the later rising edge of $\overline{\text{RAS}}$ or $\overline{\text{CAS}}$.
20. t_{WCS} , t_{RWD} , t_{CWD} , and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{\text{WCS}}; \dot{U} t_{\text{WCS}}(\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{\text{RWD}}; \dot{U} t_{\text{RWD}}(\text{min})$, $t_{\text{CWD}}; \dot{U} t_{\text{CWD}}(\text{min})$, $t_{\text{AWD}}; \dot{U} t_{\text{AWD}}(\text{min})$ and $t_{\text{CPW}}; \dot{U} t_{\text{CPW}}(\text{min})$, the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
21. t_{CWL} shall be satisfied by both $\overline{\text{UCAS}}$, $\overline{\text{LCAS}}$.
22. These parameters are referenced to $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$ leading edge in an early write cycle and to $\overline{\text{WE}}$ edge in a delayed write or a read-modify-write cycle.
23. t_{CPN} , t_{CP} , and t_{CPT} are determined by the time that both $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ are high.
24. t_{RASP} defines $\overline{\text{RAS}}$ pulse width in fast page mode cycles.
25. Assume $t_T = 2\text{ns}$.
