

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

"Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.

8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

The revision list can be viewed directly by clicking the title page.

The revision list summarizes the locations of revisions and additions. Details should always be checked by referring to the relevant text.

Keep safety first in your circuit designs!

1. Renesas Technology Corp. puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.
Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corp. product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corp. or a third party.
2. Renesas Technology Corp. assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corp. without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors. Renesas Technology Corp. assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corp. by various means, including the Renesas Technology Corp. Semiconductor home page (<http://www.renesas.com>).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corp. assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corp. semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corp. is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corp. for further details on these materials or the products contained therein.

General Precautions on Handling of Product

1. Treatment of NC Pins

Note: Do not connect anything to the NC pins.

The NC (not connected) pins are either not connected to any of the internal circuitry or are used as test pins or to reduce noise. If something is connected to the NC pins, the operation of the LSI is not guaranteed.

2. Treatment of Unused Input Pins

Note: Fix all unused input pins to high or low level.

Generally, the input pins of CMOS products are high-impedance input pins. If unused pins are in their open states, intermediate levels are induced by noise in the vicinity, a pass-through current flows internally, and a malfunction may occur.

3. Processing before Initialization

Note: When power is first supplied, the product's state is undefined.

The states of internal circuits are undefined until full power is supplied throughout the chip and a low level is input on the reset pin. During the period where the states are undefined, the register settings and the output state of each pin are also undefined. Design your system so that it does not malfunction because of processing while it is in this undefined state. For those products which have a reset function, reset the LSI immediately after the power supply has been turned on.

4. Prohibition of Access to Undefined or Reserved Address

Note: Access to undefined or reserved addresses is prohibited.

The undefined or reserved addresses may be used to expand functions, or test registers may have been allocated to these addresses. Do not access these registers; the system's operation is not guaranteed if they are accessed.

Configuration of This Manual

This manual comprises the following items:

1. General Precautions on Handling of Product
2. Configuration of This Manual
3. Preface
4. Contents
5. Overview
6. Description of Functional Modules
 - CPU and System-Control Modules
 - On-Chip Peripheral Modules

The configuration of the functional description of each module differs according to the module. However, the generic style includes the following items:

- i) Feature
- ii) Input/Output Pin
- iii) Register Description
- iv) Operation
- v) Usage Note

When designing an application system that includes this LSI, take notes into account. Each section includes notes in relation to the descriptions given, and usage notes are given, as required, as the final part of each section.

7. List of Registers
8. Electrical Characteristics
9. Appendix
10. Main Revisions and Additions in this Edition (only for revised versions)

The list of revisions is a summary of points that have been revised or added to earlier versions. This does not include all of the revised contents. For details, see the actual locations in this manual.

11. Index

Preface

The H8/3062 Group is a high-performance single-chip microcomputer that integrates peripheral functions necessary for system configuration with an H8/300H CPU featuring a 32-bit internal architecture as its core.

The on-chip peripheral functions include ROM, RAM, 16-bit timers, 8-bit timers, a programmable timing pattern controller (TPC), a watchdog timer (WDT), a serial communication interface (SCI), a D/A converter, an A/D converter, and I/O ports, providing an ideal configuration as a microcomputer for embedding in sophisticated control systems. Flash memory (F-ZTAT™*) and masked ROM are available as on-chip ROM, enabling users to respond quickly and flexibly to changing application specifications and the demands of the transition from initial to full-fledged volume production.

Note: * F-ZTAT is a trademark of Renesas Technology Corp.

Intended Readership: This manual is intended for users undertaking the design of an application system using the H8/3062 Group. Readers using this manual require a basic knowledge of electrical circuits, logic circuits, and microcomputers.

Purpose: The purpose of this manual is to give users an understanding of the hardware functions and electrical characteristics of the H8/3062 Group. Details of execution instructions can be found in the H8/300H Series Programming Manual, which should be read in conjunction with the present manual.

Using this Manual:

- For an overall understanding of the H8/3062 Group's functions
Follow the Table of Contents. This manual is broadly divided into sections on the CPU, system control functions, peripheral functions, and electrical characteristics.
- For a detailed understanding of CPU functions
Refer to the separate publication H8/300H Series Programming Manual.

Note on bit notation: Bits are shown in high-to-low order from left to right.

Related Material: The latest information is available at our web site. Please make sure that you have the most up-to-date information available.

Comparison of H8/3062 Group Product Specifications

There are 11 members of the H8/3062 Group: the H8/3062F-ZTAT R-mask version, H8/3062F-ZTAT B-mask version, and H8/3064F-ZTAT B-mask version (all with on-chip flash memory), and the H8/3062 masked ROM version, H8/3061 masked ROM version, H8/3060 masked ROM version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version.

The specifications of these products are compared below.

	H8/3062F-ZTAT R-Mask Version	H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, H8/3060 Masked ROM Version	H8/3064F-ZTAT B-Mask Version	H8/3062F-ZTAT B-Mask Version	H8/3064 Masked ROM B-Mask Version, H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, H8/3060 Masked ROM B-Mask Version

Section 8 16-Bit Timer		227
8.1	Overview.....	227
8.1.1	Features.....	227
8.1.2	Block Diagrams	229
8.1.3	Pin Configuration	232
8.1.4	Register Configuration.....	233
8.2	Register Descriptions.....	234
8.2.1	Timer Start Register (TSTR)	234

8.2.2	Timer Synchro Register (TSNC)	235
8.2.3	Timer Mode Register (TMDR).....	237
8.2.4	Timer Interrupt Status Register A (TISRA).....	240
8.2.5	Timer Interrupt Status Register B (TISR B)	243
8.2.6	Timer Interrupt Status Register C (TISRC)	246
8.2.7	Timer Counters (16TCNT).....	248
8.2.8	General Registers (GRA, GRB).....	249
8.2.9	Timer Control Registers (16TCR)	250
8.2.10	Timer I/O Control Register (TIOR).....	252
8.2.11	Timer Output Level Setting Register C (TOLR)	254
8.3	CPU Interface	256
8.3.1	16-Bit Accessible Registers	256
8.3.2	8-Bit Accessible Registers	258
8.4	Operation	259
8.4.1	Overview.....	259
8.4.2	Basic Functions.....	260
8.4.3	Synchronization	268
8.4.4	PWM Mode	269
8.4.5	Phase Counting Mode.....	273
8.4.6	16-Bit Timer Output Timing.....	275
8.5	Interrupts.....	276
8.5.1	Setting of Status Flags	276
8.5.2	Timing of Clearing of Status Flags.....	278
8.5.3	Interrupt Sources.....	279
8.6	Usage Notes	280
Section 9 8-Bit Timers		293
9.1	Overview.....	293
9.1.1	Features.....	293
9.1.2	Block Diagram.....	295
9.1.3	Pin Configuration	296
9.1.4	Register Configuration.....	297
9.2	Register Descriptions.....	298
9.2.1	Timer Counters (8TCNT).....	298
9.2.2	Time Constant Registers A (TCORA).....	299
9.2.3	Time Constant Registers B (TCORB)	300
9.2.4	Timer Control Register (8TCR).....	301
9.2.5	Timer Control/Status Registers (8TC SR)	304
9.3	CPU Interface	309
9.3.1	8-Bit Registers	309

9.4	Operation	311
9.4.1	8TCNT Count Timing	311
9.4.2	Compare Match Timing.....	312
9.4.3	Input Capture Signal Timing	313
9.4.4	Timing of Status Flag Setting	314
9.4.5	Operation with Cascaded Connection.....	316
9.4.6	Input Capture Setting.....	318
9.5	Interrupt	320
9.5.1	Interrupt Sources.....	320
9.5.2	A/D Converter Activation.....	321
9.6	8-Bit Timer Application Example	321
9.7	Usage Notes	322
9.7.1	Contention between 8TCNT Write and Clear.....	322
9.7.2	Contention between 8TCNT Write and Increment	323
9.7.3	Contention between TCOR Write and Compare Match	324
9.7.4	Contention between TCOR Read and Input Capture.....	325
9.7.5	Contention between Counter Clearing by Input Capture and Counter Increment	326
9.7.6	Contention between TCOR Write and Input Capture.....	327
9.7.7	Contention between 8TCNT Byte Write and Increment in 16-Bit Count Mode (Cascaded Connection).....	328
9.7.8	Contention between Compare Matches A and B	329
9.7.9	8TCNT Operation and Internal Clock Source Switchover	329
Section 10 Programmable Timing Pattern Controller (TPC)		333
10.1	Overview.....	333
10.1.1	Features.....	333
10.1.2	Block Diagram.....	334
10.1.3	Pin Configuration	335
10.1.4	Register Configuration.....	336
10.2	Register Descriptions.....	337
10.2.1	Port A Data Direction Register (PADDR).....	337
10.2.2	Port A Data Register (PADR).....	337
10.2.3	Port B Data Direction Register (PBDDR)	338
10.2.4	Port B Data Register (PBDR)	338
10.2.5	Next Data Register A (NDRA).....	339
10.2.6	Next Data Register B (NDRB)	341
10.2.7	Next Data Enable Register A (NDERA).....	343
10.2.8	Next Data Enable Register B (NDERB).....	344
10.2.9	TPC Output Control Register (TPCR).....	345
10.2.10	TPC Output Mode Register (TPMR).....	348

10.3	Operation	350
10.3.1	Overview.....	350
10.3.2	Output Timing	351
10.3.3	Normal TPC Output.....	352
10.3.4	Non-Overlapping TPC Output.....	354
10.3.5	TPC Output Triggering by Input Capture.....	356
10.4	Usage Notes.....	357
10.4.1	Operation of TPC Output Pins.....	357
10.4.2	Note on Non-Overlapping Output	357
Section 11 Watchdog Timer.....		359
11.1	Overview.....	359
11.1.1	Features.....	359
11.1.2	Block Diagram.....	360
11.1.3	Pin Configuration	360
11.1.4	Register Configuration.....	361
11.2	Register Descriptions.....	361
11.2.1	Timer Counter (TCNT).....	361
11.2.2	Timer Control/Status Register (TCSR).....	362
11.2.3	Reset Control/Status Register (RSTCSR).....	364
11.2.4	Notes on Register Rewriting.....	365
11.3	Operation	367
11.3.1	Watchdog Timer Operation	367
11.3.2	Interval Timer Operation	368
11.3.3	Timing of Setting of Overflow Flag (OVF).....	369
11.3.4	Timing of Setting of Watchdog Timer Reset Bit (WRST)	370
11.4	Interrupts.....	371
11.5	Usage Notes.....	371
Section 12 Serial Communication Interface.....		373
12.1	Overview.....	373
12.1.1	Features.....	373
12.1.2	Block Diagram.....	375
12.1.3	Pin Configuration	376
12.1.4	Register Configuration.....	377
12.2	Register Descriptions.....	378
12.2.1	Receive Shift Register (RSR)	378
12.2.2	Receive Data Register (RDR).....	378
12.2.3	Transmit Shift Register (TSR).....	379
12.2.4	Transmit Data Register (TDR)	379

12.2.5	Serial Mode Register (SMR)	380
12.2.6	Serial Control Register (SCR)	384
12.2.7	Serial Status Register (SSR)	389
12.2.8	Bit Rate Register (BRR)	395
12.3	Operation	403
12.3.1	Overview.....	403
12.3.2	Operation in Asynchronous Mode	406
12.3.3	Multiprocessor Communication	415
12.3.4	Synchronous Operation	422
12.4	SCI Interrupts.....	431
12.5	Usage Notes	432
12.5.1	Notes on Use of SCI	432
Section 13 Smart Card Interface		437
13.1	Overview.....	437
13.1.1	Features.....	437
13.1.2	Block Diagram.....	438
13.1.3	Pin Configuration	439
13.1.4	Register Configuration.....	439
13.2	Register Descriptions	440
13.2.1	Smart Card Mode Register (SCMR).....	440
13.2.2	Serial Status Register (SSR)	442
13.2.3	Serial Mode Register (SMR)	443
13.2.4	Serial Control Register (SCR)	444
13.3	Operation	445
13.3.1	Overview.....	445
13.3.2	Pin Connections	445
13.3.3	Data Format	446
13.3.4	Register Settings	448
13.3.5	Clock.....	450
13.3.6	Transmitting and Receiving Data	452
13.4	Usage Notes	460
Section 14 A/D Converter.....		465
14.1	Overview.....	465
14.1.1	Features.....	465
14.1.2	Block Diagram.....	466
14.1.3	Pin Configuration	467
14.1.4	Register Configuration.....	468
14.2	Register Descriptions	469

14.2.1	A/D Data Registers A to D (ADDRA to ADDR D)	469
14.2.2	A/D Control/Status Register (ADCSR)	470
14.2.3	A/D Control Register (ADCR)	472
14.3	CPU Interface	473
14.4	Operation	475
14.4.1	Single Mode (SCAN = 0)	475
14.4.2	Scan Mode (SCAN = 1).....	477
14.4.3	Input Sampling and A/D Conversion Time	479
14.4.4	External Trigger Input Timing.....	480
14.5	Interrupts.....	481
14.6	Usage Notes.....	481
Section 15 D/A Converter.....		487
15.1	Overview.....	487
15.1.1	Features.....	487
15.1.2	Block Diagram.....	488
15.1.3	Pin Configuration	489
15.1.4	Register Configuration.....	489
15.2	Register Descriptions.....	490
15.2.1	D/A Data Registers 0 and 1 (DADR0, DADR1)	490
15.2.2	D/A Control Register (DACR)	490
15.2.3	D/A Standby Control Register (DASTCR).....	492
15.3	Operation	492
15.4	D/A Output Control	494
Section 16 RAM		495
16.1	Overview.....	495
16.1.1	Block Diagram.....	496
16.1.2	Register Configuration.....	496
16.2	System Control Register (SYSCR).....	497
16.3	Operation	498
Section 17 ROM [H8/3062F-ZTAT R-Mask Version, On-Chip Masked ROM Models]		499
17.1	Overview.....	499
17.2	Overview of Flash Memory (H8/3062F-ZTAT R-Mask Version)	500
17.2.1	Features.....	500
17.2.2	Block Diagram.....	501
17.2.3	Pin Configuration	502
17.2.4	Register Configuration.....	502

17.3	Flash Memory Register Descriptions.....	503
17.3.1	Flash Memory Control Register (FLMCR)	503
17.3.2	Erase Block Register (EBR)	507
17.3.3	RAM Control Register (RAMCR).....	508
17.3.4	Flash Memory Status Register (FLMSR)	510
17.4	On-Board Programming Mode	512
17.4.1	Boot Mode	515
17.4.2	User Program Mode.....	520
17.5	Flash Memory Programming/Erasing.....	522
17.5.1	Program Mode	523
17.5.2	Program-Verify Mode	524
17.5.3	Erase Mode	526
17.5.4	Erase-Verify Mode	526
17.6	Flash Memory Protection.....	528
17.6.1	Hardware Protection	528
17.6.2	Software Protection	530
17.6.3	Error Protection	531
17.6.4	NMI Input Disabling Conditions	533
17.7	Flash Memory Emulation in RAM	534
17.8	Flash Memory PROM Mode	536
17.8.1	Socket Adapters and Memory Map	536
17.8.2	Notes on Use of PROM Mode	537
17.9	Flash Memory Programming and Erasing Precautions.....	538
17.10	Masked ROM (H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, H8/3060 Masked ROM Version) Overview	544
17.10.1	Block Diagram.....	544
17.11	Notes on Ordering Masked ROM Version Chips	545
17.12	Notes when Converting the F-ZTAT Application Software to the Masked ROM Versions	546
Section 18	H8/3064 Internal Voltage Step-Down Version ROM [H8/3064F-ZTAT B-Mask Version, H8/3064 Masked ROM B-Mask Version].....	547
18.1	Overview.....	547
18.1.1	Differences from H8/3062F-ZTAT R-Mask Version and H8/3064F-ZTAT B-Mask Version.....	548
18.2	Features.....	549
18.2.1	Block Diagram.....	550
18.2.2	Pin Configuration	551
18.2.3	Register Configuration.....	551

18.3	Register Descriptions.....	552
18.3.1	Flash Memory Control Register 1 (FLMCR1)	552
18.3.2	Flash Memory Control Register 2 (FLMCR2)	556
18.3.3	Erase Block Register 1 (EBR1)	557
18.3.4	Erase Block Register 2 (EBR2)	557
18.3.5	RAM Control Register (RAMCR).....	558
18.4	Overview of Operation	560
18.4.1	Mode Transitions	560
18.4.2	On-Board Programming Modes.....	562
18.4.3	Flash Memory Emulation in RAM	564
18.4.4	Block Configuration	565
18.5	On-Board Programming Mode	566
18.5.1	Boot Mode	567
18.5.2	User Program Mode.....	572
18.6	Flash Memory Programming/Erasing.....	574
18.6.1	Program Mode	576
18.6.2	Program-Verify Mode	576
18.6.3	Erase Mode.....	581
18.6.4	Erase-Verify Mode	581
18.7	Flash Memory Protection.....	583
18.7.1	Hardware Protection	583
18.7.2	Software Protection	584
18.7.3	Error Protection	585
18.8	Flash Memory Emulation in RAM	587
18.9	NMI Input Disabling Conditions	590
18.10	Flash Memory PROM Mode	591
18.10.1	Socket Adapters and Memory Map	591
18.10.2	Notes on Use of PROM Mode	592
18.11	Flash Memory Programming and Erasing Precautions.....	592
18.12	Masked ROM (H8/3064 Masked ROM B-Mask Version) Overview.....	598
18.12.1	Block Diagram.....	598
18.13	Notes on Ordering Masked ROM Version Chips	599
18.14	Notes when Converting the F-ZTAT Application Software to the Masked ROM Version.....	600
Section 19	H8/3062 Internal Voltage Step-Down Version ROM [H8/3062F-ZTAT B-Mask Version, Masked ROM B-Mask Versions of H8/3062, H8/3061, and H8/3060]	601
19.1	Overview.....	601

19.1.1	Differences from H8/3062F-ZTAT R-Mask Version and H8/3062F-ZTAT B-Mask Version.....	602
19.2	Features.....	603
19.2.1	Block Diagram.....	604
19.2.2	Pin Configuration	605
19.2.3	Register Configuration.....	605
19.3	Register Descriptions	606
19.3.1	Flash Memory Control Register 1 (FLMCR1)	606
19.3.2	Flash Memory Control Register 2 (FLMCR2)	610
19.3.3	Erase Block Register (EBR)	611
19.3.4	RAM Control Register (RAMCR).....	612
19.4	Overview of Operation	614
19.4.1	Mode Transitions	614
19.4.2	On-Board Programming Modes.....	616
19.4.3	Flash Memory Emulation in RAM	618
19.4.4	Block Configuration	619
19.5	On-Board Programming Mode	620
19.5.1	Boot Mode	621
19.5.2	User Program Mode.....	626
19.6	Flash Memory Programming/Erasing	628
19.6.1	Program Mode	630
19.6.2	Program-Verify Mode	630
19.6.3	Erase Mode	635
19.6.4	Erase-Verify Mode	635
19.7	Flash Memory Protection.....	637
19.7.1	Hardware Protection	637
19.7.2	Software Protection	638
19.7.3	Error Protection	639
19.8	Flash Memory Emulation in RAM	641
19.9	NMI Input Disabling Conditions	643
19.10	Flash Memory PROM Mode	644
19.10.1	Socket Adapters and Memory Map	644
19.10.2	Notes on Use of PROM Mode.....	645
19.11	Flash Memory Programming and Erasing Precautions.....	645
19.12	Masked ROM (H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, H8/3060 Masked ROM B-Mask Version) Overview	651
19.12.1	Block Diagram.....	651
19.13	Notes on Ordering Masked ROM Version Chips	652
19.14	Notes when Converting the F-ZTAT Application Software to the Masked ROM Versions	653

Section 20	Clock Pulse Generator	655
20.1	Overview.....	655
20.1.1	Block Diagram.....	656
20.2	Oscillator Circuit	656
20.2.1	Connecting a Crystal Resonator	656

20.3	Duty Adjustment Circuit.....	662
20.4	Prescalers	662
20.5	Frequency Divider	662
20.5.1	Register Configuration.....	663
20.5.2	Division Control Register (DIVCR).....	663
20.5.3	Usage Notes	664
Section 21	Power-Down State	665
21.1	Overview.....	665
21.2	Register Configuration.....	667
21.2.1	System Control Register (SYSCR).....	667
21.2.2	Module Standby Control Register H (MSTCRH).....	669
21.2.3	Module Standby Control Register L (MSTCRL)	670
21.3	Sleep Mode	672
21.3.1	Transition to Sleep Mode.....	672
21.3.2	Exit from Sleep Mode.....	672
21.4	Software Standby Mode.....	672
21.4.1	Transition to Software Standby Mode	672
21.4.2	Exit from Software Standby Mode	673
21.4.3	Selection of Waiting Time for Exit from Software Standby Mode	673
21.4.4	Sample Application of Software Standby Mode.....	675
21.4.5	Usage Note	675
21.4.6	Cautions on Clearing the software Standby Mode of F-ZTAT Version	676
21.5	Hardware Standby Mode	677
21.5.1	Transition to Hardware Standby Mode.....	677
21.5.2	Exit from Hardware Standby Mode.....	677
21.5.3	Timing for Hardware Standby Mode.....	678
21.6	Module Standby Function.....	679
21.6.1	Module Standby Timing.....	679
21.6.2	Read/Write in Module Standby	679
21.6.3	Usage Notes	679
21.7	System Clock Output Disabling Function	680

Section 22	Electrical Characteristics	681
22.1	Electrical Characteristics of H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, and H8/3060 Masked ROM Version	682
22.1.1	Absolute Maximum Ratings	682
22.1.2	DC Characteristics	683
22.1.3	AC Characteristics	694
22.1.4	A/D Conversion Characteristics	700
22.1.5	D/A Conversion Characteristics	702
22.2	Electrical Characteristics of H8/3062F-ZTAT R-Mask Version	703
22.2.1	Absolute Maximum Ratings	703
22.2.2	DC Characteristics	704
22.2.3	AC Characteristics	712
22.2.4	A/D Conversion Characteristics	718
22.2.5	D/A Conversion Characteristics	720
22.2.6	Flash Memory Characteristics	721
22.3	Electrical Characteristics of H8/3064F-ZTAT B-Mask Version	725
22.3.1	Absolute Maximum Ratings	725
22.3.2	DC Characteristics	726
22.3.3	AC Characteristics	731
22.3.4	A/D Conversion Characteristics	737
22.3.5	D/A Conversion Characteristics	738
22.3.6	Flash Memory Characteristics	739
22.4	Electrical Characteristics of H8/3064 Masked ROM B-Mask Version	741
22.4.1	Absolute Maximum Ratings	741
22.4.2	DC Characteristics	742
22.4.3	AC Characteristics	746
22.4.4	A/D Conversion Characteristics	752
22.4.5	D/A Conversion Characteristics	753
22.5	Electrical Characteristics of H8/3062F-ZTAT B-Mask Version	754
22.5.1	Absolute Maximum Ratings	754
22.5.2	DC Characteristics	755
22.5.3	AC Characteristics	760
22.5.4	A/D Conversion Characteristics	766
22.5.5	D/A Conversion Characteristics	767
22.5.6	Flash Memory Characteristics	768
22.6	Electrical Characteristics of H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, and H8/3060 Masked ROM B-Mask Version	770
22.6.1	Absolute Maximum Ratings	770
22.6.2	DC Characteristics	771
22.6.3	AC Characteristics	775

22.6.4	A/D Conversion Characteristics	781
22.6.5	D/A Conversion Characteristics	782
22.7	Operational Timing.....	783
22.7.1	Clock Timing.....	783
22.7.2	Control Signal Timing	784
22.7.3	Bus Timing	785
22.7.4	TPC and I/O Port Timing.....	789
22.7.5	Timer Input/Output Timing	789
22.7.6	SCI Input/Output Timing.....	790
Appendix A Instruction Set.....		791
A.1	Instruction List.....	791
A.2	Operation Code Maps	806
A.3	Number of States Required for Execution	809
Appendix B Internal I/O Registers		818
B.1	Address List (H8/3062F-ZTAT R-Mask Version, H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, H8/3060 Masked ROM Version).....	819
B.2	Address List (H8/3064F-ZTAT B-Mask Version, H8/3064 Masked ROM B-Mask Version).....	829
B.3	Address List (H8/3062F-ZTAT B-Mask Version, H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, and H8/3060 Masked ROM B-Mask Version).....	839
B.4	Functions	849
Appendix C I/O Port Block Diagrams		919
C.1	Port 1 Block Diagram	919

Section 1 Overview

1.1 Overview

The H8/3062 Group is a series of microcontrollers (MCUs) that integrate system supporting functions together with an H8/300H CPU core having an original Renesas architecture.

The H8/300H CPU has a 32-bit internal architecture with sixteen 16-bit general registers, and a concise, optimized instruction set designed for speed. It can address a 16-Mbyte linear address space. Its instruction set is upward-compatible at the object-code level with the H8/300 CPU, enabling easy porting of software from the H8/300 Series.

The on-chip system supporting functions include ROM, RAM, a 16-bit timer, an 8-bit timer, a programmable timing pattern controller (TPC), a watchdog timer (WDT), a serial communication interface (SCI), an A/D converter, a D/A converter, I/O ports, and other facilities.

The 11 members of the H8/3062 Group are the H8/3062F-ZTAT R-mask version, H8/3062 (masked ROM version), H8/3061 (masked ROM version), H8/3060 (masked ROM version), H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version.

Seven MCU operating modes offer a choice of bus width and address space size. The modes (modes 1 to 7) include two single-chip modes and five expanded modes.

In addition to its masked ROM versions, the H8/3062 Group has F-ZTAT™* versions with on-chip flash memory that allows programs to be freely rewritten by the user. This version enables users to respond quickly and flexibly to changing application specifications, growing production volumes, and other conditions.

Table 1.1 summarizes the features of the H8/3062 Group.

Note: * F-ZTAT is a trademark of Renesas Technology Corp.

Table 1.1 Features

Feature	Description		
CPU	Upward-compatible with the H8/300 CPU at the object-code level General-register machine		
	<ul style="list-style-type: none"> Sixteen 16-bit general registers (also usable as sixteen 8-bit registers plus eight 16-bit registers, or as eight 32-bit registers) 		
	High-speed operation		
		Maximum clock rate	Add/ subtract
			Multiply/ divide
	H8/3062F-ZTAT R-Mask version	20 MHz	100 ns
	H8/3062 (masked ROM version)		700 ns

	H8/3064F-ZTAT B-mask version	256 kbytes	8 kbytes
H8/3064 masked ROM B-mask version			
Interrupt controller	<ul style="list-style-type: none"> • Seven external interrupt pins: NMI, \overline{IRQ}_0 to \overline{IRQ}_5 • 27 internal interrupts • Three selectable interrupt priority levels 		
Bus controller	<ul style="list-style-type: none"> • Address space can be partitioned into eight areas, with independent bus specifications in each area • Chip select output available for areas 0 to 7 • 8-bit access or 16-bit access selectable for each area • Two-state or three-state access selectable for each area • Selection of two wait modes • Number of program wait states selectable for each area • Bus arbitration function • Two address update modes 		
16-bit timer, 3 channels	<ul style="list-style-type: none"> • Three 16-bit timer channels, capable of processing up to six pulse outputs or six pulse inputs • 16-bit timer counter (channels 0 to 2) • Two multiplexed output compare/input capture pins (channels 0 to 2) • Operation can be synchronized (channels 0 to 2) • PWM mode available (channels 0 to 2) • Phase counting mode available (channel 2) 		

Feature	Description
8-bit timer, 4 channels	<ul style="list-style-type: none">• 8-bit up-counter (external event count capability)• Two time constant registers• Two channels can be connected
Programmable timing pattern controller (TPC)	<ul style="list-style-type: none">• Maximum 16-bit pulse output, using 16-bit timer as time base• Up to four 4-bit pulse output groups (or one 16-bit group, or two 8-bit groups)• Non-overlap mode available
Watchdog timer (WDT), 1 channel	<ul style="list-style-type: none">• Internal reset signal can be generated by overflow• Reset signal can be output externally (not available in on-chip flash memory versions)• Usable as an interval timer
Serial communication interface (SCI), 2 channels	<ul style="list-style-type: none">• Selection of asynchronous or synchronous mode• Full duplex: can transmit and receive simultaneously• On-chip baud-rate generator• Smart card interface extended functions added
A/D converter	<ul style="list-style-type: none">• Resolution: 10 bits• Eight channels, with selection of single or scan mode• Variable analog conversion voltage range• Sample-and-hold function• A/D conversion can be started by an external trigger or 8-bit timer compare-match
D/A converter	<ul style="list-style-type: none">• Resolution: 8 bits• Two channels• D/A outputs can be sustained in software standby mode
I/O ports	<ul style="list-style-type: none">• 70 input/output pins• 9 input-only pins

1.2 Block Diagram

Figure 1.1 shows an internal block diagram.

Figure 1.1 Block Diagram

1.3 Pin Description

1.3.1 Pin Arrangement

The pin arrangement of the H8/3062 Group is shown in figures 1.2 to 1.5. Differences in the H8/3062 Group pin arrangements are shown in table 1.2. The H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version have a V_{CL} pin. See section 1.5, Notes on H8/3064F-ZTAT B-Mask Version, H8/3062F-ZTAT B-Mask Version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version. Except for the differences shown in table 1.2, the pin arrangements are the same.

Table 1.2 Comparison of H8/3062 Group Pin Arrangements

Package	Pin Number	H8/3062F-ZTAT R-Mask Version	H8/3062 Masked ROM Version	H8/3061 Masked ROM Version	H8/3060 Masked ROM Version	H8/3064 F-ZTAT B-Mask Version	H8/3062 F-ZTAT B-Mask Version

1.3.2 Pin Functions

Table 1.3 summarizes the pin functions. The H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version have a V_{CL} pin, and require the connection of an external capacitor.

Table 1.3 Pin Functions

Type	Symbol	Pin No.		I/O	Name and Function
		FP-100B TFP-100B	FP-100A		
Power	V_{CC}	1* ¹ , 35, 68	3* ¹ , 37, 70	Input	Power: For connection to the power supply. Connect all V_{CC} pins to the system power supply.
	V_{SS}	11, 22, 44, 57, 65, 92	13, 24, 46, 59, 67, 94	Input	Ground: For connection to ground (0 V). Connect all V_{SS} pins to the 0-V system power supply.
Internal step-down pin	V_{CL}	1* ²	3* ²	Output	Connect an external capacitor between this pin and GND (0 V). <u>Do not connect to V_{CC}.</u> 
Clock	XTAL	67	69	Input	For connection to a crystal resonator. For examples of crystal resonator and external clock input, see section 20, Clock Pulse Generator.
	EXTAL	66	68	Input	For connection to a crystal resonator or input of an external clock signal. For examples of crystal resonator and external clock input, see section 20, Clock Pulse Generator.
	ϕ	61	63	Output	System clock: Supplies the system clock to external devices.

Type	Symbol	Pin No.		I/O	Name and Function
		FP-100B	FP-100A		
Operating mode control	MD ₂ to MD ₀	75 to 73	77 to 75	Input	Modes 2 to 0: For setting the operating mode, as follows. Inputs at these pins must not be changed during operation.
					MD ₂ MD ₁ MD ₀ Operating Mode
					0 0 0 Setting prohibited
					0 0 1 Mode 1
					0 1 0 Mode 2
					0 1 1 Mode 3
					1 0 0 Mode 4
					1 0 1 Mode 5
					1 1 0 Mode 6
					1 1 1 Mode 7
System control	$\overline{\text{RES}}$	63	65	Input	Reset input: When driven low, this pin resets the chip. This pin must be driven low at power-up.
	$\overline{\text{RESO}}$	10	12	Output	Reset output (On-chip masked ROM versions): Outputs the reset signal generated by the watchdog timer to external devices.
	FWE	10	12	Input	Write enable signal (On-chip flash memory versions): Flash memory programming control signal
	$\overline{\text{STBY}}$	62	64	Input	Standby: When driven low, this pin forces a transition to hardware standby mode.
	$\overline{\text{BREQ}}$	59	61	Input	Bus request: Used by an external bus master to request the bus right.
	$\overline{\text{BACK}}$	60	62	Output	Bus request acknowledge: Indicates that the bus has been granted to an external bus master.
Interrupts	NMI	64	66	Input	Nonmaskable interrupt: Requests a nonmaskable interrupt.
	$\overline{\text{IRQ}}_5$ to $\overline{\text{IRQ}}_0$	17, 16, 90 to 87	19, 18, 92 to 89	Input	Interrupt request 5 to 0: Maskable interrupt request pins
Address bus	A ₂₃ to A ₀	97 to 100, 56 to 45, 43 to 36	99, 100, 1, 2, 58 to 47, 45 to 38	Output	Address bus: Output address signals.

Type	Symbol	Pin No.		I/O	Name and Function
		FP-100B	FP-100A		
Data bus	D ₁₅ to D ₀	34 to 23, 21 to 18	36 to 25, 23 to 20	Input/ output	Data bus: Bidirectional data bus
Bus control	\overline{CS}_7 to \overline{CS}_0	2 to 5, 88 to 91	4 to 7, 90 to 93	Output	Chip select: Select signals for areas 7 to 0.
	\overline{AS}	69	71	Output	Address strobe: Goes low to indicate valid address output on the address bus.
	\overline{RD}	70	72	Output	Read: Goes low to indicate reading from the external address space.
	\overline{HWR}	71	73	Output	High write: Goes low to indicate writing to the external address space; indicates valid data on the upper data bus (D ₁₅ to D ₈).
	\overline{LWR}	72	74	Output	Low write: Goes low to indicate writing to the external address space; indicates valid data on the lower data bus (D ₇ to D ₀).
	\overline{WAIT}	58	60	Input	Wait: Requests insertion of wait states in bus cycles during access to the external address space.
16-bit timer	TCLKD to TCLKA	96 to 93	98 to 95	Input	Clock input D to A: External clock inputs
	TIOCA ₂ to TIOCA ₀	99, 97, 95	1, 99, 97	Input/ output	Input capture/output compare A2 to A0: GRA2 to GRA0 output compare or input capture, or PWM output
	TIOCB ₂ to TIOCB ₀	100, 98, 96	2, 100, 98	Input/ output	Input capture/output compare B2 to B0: GRB2 to GRB0 output compare or input capture
8-bit timer	TMO ₀ , TMO ₂	2, 4	4, 6	Output	Compare match output: Compare match output pins
	TMIO ₁ , TMIO ₃	3, 5	5, 7	Input/ output	Input capture input/compare match output: Input capture input or compare match output pins
	TCLKD to TCLKA	96 to 93	98 to 95	Input	Counter external clock input: These pins input an external clock to the counters.

Type	Symbol	Pin No.		I/O	Name and Function
		FP-100B	FP-100A		
Program- mable timing pattern controller (TPC)	TP ₁₅ to TP ₀	9 to 2, 100 to 93	11 to 4, 2, 1, 100 to 95	Output	TPC output 15 to 0: Pulse output
Serial communi- cation interface (SCI)	TxD ₁ , TxD ₀	13, 12	15, 14	Output	Transmit data (channels 0, 1): SCI data output
	RxD ₁ , RxD ₀	15, 14	17, 16	Input	Receive data (channels 0, 1): SCI data input
	SCK ₁ , SCK ₀	17, 16	19, 18	Input/ output	Serial clock (channels 0, 1): SCI clock input/output
A/D converter	AN ₇ to AN ₀	85 to 78	87 to 80	Input	Analog 7 to 0: Analog input pins
	ADTRG	90	92	Input	A/D conversion external trigger input: External trigger input for starting A/D conversion
D/A converter	DA ₁ , DA ₀	85, 84	87, 86	Output	Analog output: Analog output from the D/A converter
Analog power supply	AV _{CC}	76	78	Input	Power supply pin for the A/D and D/A converters. Connect to the system power supply when not using the A/D and D/A converters.
	AV _{SS}	86	88	Input	Ground pin for the A/D and D/A converters. Connect to system ground (0 V).
	V _{REF}	77	79	Input	Reference voltage input pin for the A/D and D/A converters. Connect to the system power supply when not using the A/D and D/A converters.

Type	Symbol	Pin No.		I/O	Name and Function
		FP-100B TFP-100B	FP-100A		
I/O ports	P1 ₇ to P1 ₀	43 to 36	45 to 38	Input/ output	Port 1: Eight input/output pins. The direction of each pin can be selected in the port 1 data direction register (P1DDR).
	P2 ₇ to P2 ₀	52 to 45	54 to 47	Input/ output	Port 2: Eight input/output pins. The direction of each pin can be selected in the port 2 data direction register (P2DDR).
	P3 ₇ to P3 ₀	34 to 27	36 to 29	Input/ output	Port 3: Eight input/output pins. The direction of each pin can be selected in the port 3 data direction register (P3DDR).
	P4 ₇ to P4 ₀	26 to 23, 21 to 18	28 to 25, 23 to 20	Input/ output	Port 4: Eight input/output pins. The direction of each pin can be selected in the port 4 data direction register (P4DDR).
	P5 ₃ to P5 ₀	56 to 53	58 to 55	Input/ output	Port 5: Four input/output pins. The direction of each pin can be selected in the port 5 data direction register (P5DDR).
	P6 ₇ to P6 ₀	61, 72 to 69, 60 to 58	63, 74 to 71, 62 to 60	Input/ output	Port 6: Eight input/output pins. The direction of each pin can be selected in the port 6 data direction register (P6DDR).
	P7 ₇ to P7 ₀	85 to 78	87 to 80	Input	Port 7: Eight input pins
	P8 ₄ to P8 ₀	91 to 87	93 to 89	Input/ output	Port 8: Five input/output pins. The direction of each pin can be selected in the port 8 data direction register (P8DDR).
	P9 ₅ to P9 ₀	17 to 12	19 to 14	Input/ output	Port 9: Six input/output pins. The direction of each pin can be selected in the port 9 data direction register (P9DDR).
	PA ₇ to PA ₀	100 to 93	2, 1, 100 to 95	Input/ output	Port A: Eight input/output pins. The direction of each pin can be selected in the port A data direction register (PADDR).
	PB ₇ to PB ₀	9 to 2	11 to 4	Input/ output	Port B: Eight input/output pins. The direction of each pin can be selected in the port B data direction register (PBDDR).

- Notes:
1. In the H8/3062F-ZTAT R-mask version, H8/3062 masked ROM version, H8/3061 masked ROM version, and H8/3060 masked ROM version
 2. In the H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version.

1.3.3 Pin Assignments in Each Mode

Table 1.4 lists the pin assignments in each mode.

Table 1.4 Pin Assignments in Each Mode (FP-100B or TFP-100B, FP-100A)

Pin No.		Pin Name

- Notes:
- In modes 1, 3, and 5 the $P4_0$ to $P4_7$ functions of pins $P4_0/D_0$ to $P4_7/D_7$ are selected after a reset, but they can be changed by software.
 - In modes 2 and 4 the D_0 to D_7 functions of pins $P4_0/D_0$ to $P4_7/D_7$ are selected after a reset, but they can be changed by software.
 - Functions as \overline{RES}_0 in the on-chip masked ROM versions, and as FWE in the on-chip flash memory versions. Functions as the programming control signal in modes 5 and 7.
 - Functions as V_{CC} in the H8/3062F-ZTAT R-mask version, H8/3062 masked ROM version, H8/3061 masked ROM version, and H8/3060 masked ROM version. In the H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version, this pin functions as V_{CL} .

1.4 Notes on H8/3062F-ZTAT R-Mask Version

Points to be noted when using the H8/3062F-ZTAT R-mask version are given below.

1.4.1 Pin Arrangement

The H8/3062F-ZTAT R-mask version has the same pin arrangement as the H8/3062 masked ROM version, H8/3061 masked ROM version, and H8/3060 masked ROM version. Except for the V_{CL} pin, it also has the same pin arrangement as the H8/3062F-ZTAT B-mask version, H8/3064F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version.

1.4.2 Differences between H8/3062F-ZTAT R-Mask Version and H8/3064F-ZTAT B-Mask Version

Table 1.5 shows the differences between the H8/3062F-ZTAT R-mask version and the on-chip masked ROM versions.

Table 1.5 Differences between H8/3062F-ZTAT R-Mask Version and On-Chip Masked ROM Versions

Item	On-Chip Flash Memory Versions	On-Chip Masked ROM Versions																		
	HD64F3062R	HD6433062	HD6433061	HD6433060																
ROM		128 kbytes masked ROM	96 kbytes masked ROM	64 kbytes masked ROM																
Address output functions	Choice of address update mode 1 (compatible with previous H8/300H Series) or address update mode 2 See the section on the bus controller for details.																			
ADRCR register (H'FEE01E)	<table style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <tr> <td style="padding: 0 10px;">7</td> <td style="padding: 0 10px;">6</td> <td style="padding: 0 10px;">5</td> <td style="padding: 0 10px;">4</td> <td style="padding: 0 10px;">3</td> <td style="padding: 0 10px;">2</td> <td style="padding: 0 10px;">1</td> <td style="padding: 0 10px;">0</td> </tr> <tr> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">—</td> <td style="border: 1px solid black; text-align: center;">ADRCRCTL</td> </tr> </table> <p>See the section on the bus controller for the bit function.</p>				7	6	5	4	3	2	1	0	—	—	—	—	—	—	—	ADRCRCTL
7	6	5	4	3	2	1	0													
—	—	—	—	—	—	—	ADRCRCTL													

The address output functions and ADRCR register specification of the H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version are the same as for the H8/3062F-ZTAT R-mask version.

1.5 Notes on H8/3064F-ZTAT B-Mask Version, H8/3062F-ZTAT B-Mask Version, H8/3064 Masked ROM B-Mask Version, H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, and H8/3060 Masked ROM B-Mask Version

The H8/3062 Group includes one model with 128-kbyte on-chip flash memory, the H8/3062F-ZTAT B-mask version developed on the basis of the H8/3062F-ZTAT R-mask version, and one model with 256-kbyte large-capacity on-chip flash memory, the H8/3064F-ZTAT B-mask version.

The H8/3062F-ZTAT B-mask version and H8/3064F-ZTAT B-mask version have the following features:

1. Low power consumption
2. Functional compatibility with the H8/3062F-ZTAT R-mask version
3. Pin arrangement compatibility (except for the V_{CL} pin)

Points to be noted when using the H8/3062F-ZTAT B-mask version or H8/3064F-ZTAT B-mask version are given below.

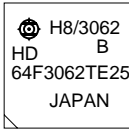

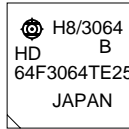

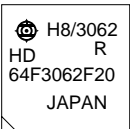

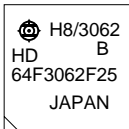

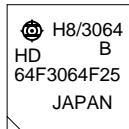

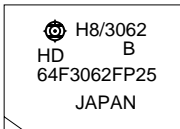

1.5.1 Pin Arrangement

Except for the V_{CL} pin, the H8/3062F-ZTAT R-mask version has the same pin arrangement as the H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version.

1.5.2 Product Type Names and Markings

Table 1.6 shows the product type names and differences in sample markings for the H8/3062F-ZTAT R-mask version, H8/3062F-ZTAT B-mask version, and H8/3064F-ZTAT B-mask version.

Table 1.6 Differences in H8/3062F-ZTAT R-Mask Version, H8/3062F-ZTAT B-Mask Version, and H8/3064F-ZTAT B-Mask Version Markings

		H8/3062F-ZTAT R-Mask Version	H8/3062F-ZTAT B-Mask Version	H8/3064F-ZTAT B-Mask Version
TFP-100	Product type name	HD64F3062RTE	HD64F3062BTE	HD64F3064BTE
	Sample markings		 "B" is printed above the type name.	 "B" is printed above the type name.
FP-100B	Product type name	HD64F3062RF	HD64F3062BF	HD64F3064BF
	Sample markings		 "B" is printed above the type name.	 "B" is printed above the type name.
FP-100A	Product type name	HD64F3062RFP	HD64F3062BFP	HD64F3064BFP
	Sample markings		 "B" is printed above the type name.	 "B" is printed above the type name.

1.5.3 V_{CL} Pin

The H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, and on-chip masked ROM B-mask versions have a V_{CL} (internal step-down) pin, to which a 0.1 μF internal voltage stabilization capacitor must be connected.

The method of connecting the external capacitor is shown in figure 1.6.

Do not connect the V_{CC} power supply to the V_{CL} pin (Connect the V_{CC} power supply to other V_{CC} pins as usual). Note that the V_{CL} output pin occupies the same location as a V_{CC} pin in the H8/3062F-ZTAT R-mask version and on-chip masked ROM versions.

Figure 1.6 H8/3062F-ZTAT B-Mask Version, H8/3064F-ZTAT B-Mask Version, and On-Chip Masked ROM B-Mask Versions

1.5.4 Notes on Changeover to On-Chip Masked ROM Versions and On-Chip Masked ROM B-Mask Versions

- (1) Care is required when changing from the H8/3062F-ZTAT B-mask version with on-chip flash memory to a model with on-chip masked ROM.

An external capacitor must be connected to the V_{CL} pin of the H8/3062F-ZTAT B-mask version (5 V model). This V_{CL} pin occupies the same location as a V_{CC} pin in the on-chip masked ROM versions. Changeover to a masked ROM version must therefore be taken into account when undertaking pattern design, etc., in the board design stage.

- (2) When changing from the H8/3062F-ZTAT B-mask version with on-chip flash memory to the on-chip masked ROM B-mask version, note (1) above does not need to be considered because the V_{CL} pin is assigned to the same location in both versions. It does not need to be considered either when changing from the H8/3064F-ZTAT B-mask version to the on-chip masked ROM B-mask version.

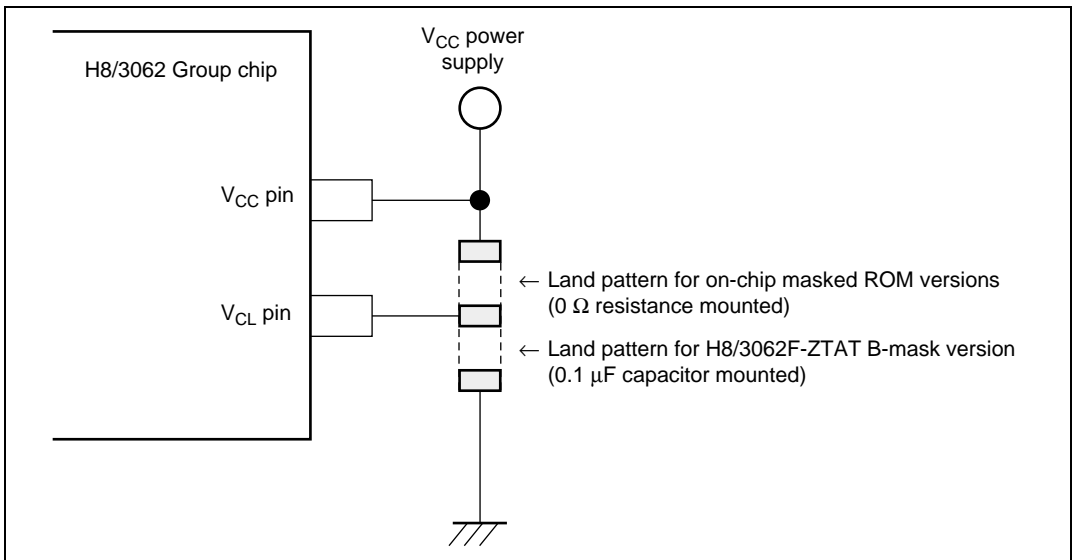

Figure 1.7 Example of Board Pattern Providing for External Capacitor

1.6 Setting Oscillation Settling Wait Time

When software standby mode is used, after exiting software standby mode a wait period must be provided to allow the clock to stabilize. Select the length of time for which the CPU and peripheral functions are to wait by setting bits STS2 to STS0 in the system control register (SYSCR) and bits DIV1 and DIV0 in the division ratio control register (DIVCR) according to the operating frequency of the chip.

For the H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, and on-chip masked ROM B-mask versions ensure that the oscillation settling wait time is at least 0.1 ms when operating on an external clock.

For setting details, see section 21.4.3, Selection of Waiting Time for Exit from Software Standby Mode.

1.7 Caution on Crystal Resonator Connection

The H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, and on-chip masked ROM B-mask versions support an operating frequency of up to 25 MHz. If a crystal resonator with a frequency higher than 20 MHz is connected, attention must be paid to circuit constants such as external load capacitance values. For details see section 20.2.1, Connecting a Crystal Resonator.

Section 2 CPU

2.1 Overview

The H8/300H CPU is a high-speed central processing unit with an internal 32-bit architecture that is upward-compatible with the H8/300 CPU. The H8/300H CPU has sixteen 16-bit general registers, can address a 16-Mbyte linear address space, and is ideal for realtime control.

2.1.1 Features

The H8/300H CPU has the following features.

- Upward compatibility with H8/300 CPU
Can execute H8/300 Series object programs.
- General-register architecture
Sixteen 16-bit general registers (also usable as sixteen 8-bit registers or eight 32-bit registers)
- 64 basic instructions
 - 8/16/32-bit arithmetic and logic instructions
 - Multiply and divide instructions
 - Powerful bit-manipulation instructions
- Eight addressing modes
 - Register direct [Rn]
 - Register indirect [@ERn]
 - Register indirect with displacement [@(d:16, ERn) or @(d:24, ERn)]
 - Register indirect with post-increment or pre-decrement [@ERn+ or @-ERn]
 - Absolute address [@aa:8, @aa:16, or @aa:24]
 - Immediate [#xx:8, #xx:16, or #xx:32]
 - Program-counter relative [@(d:8, PC) or @(d:16, PC)]
 - Memory indirect [@@aa:8]
- 16-Mbyte linear address space
- High-speed operation
 - All frequently-used instructions execute in two to four states
 - Maximum clock frequency:
20 MHz (H8/3062F-ZTAT R-mask version, H8/3062 masked ROM version, H8/3061 masked ROM version, H8/3060 masked ROM version)

25 MHz (H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version)

- 8/16/32-bit register-register add/subtract: 100 ns@20 MHz (80 ns@25 MHz)
- 8×8 -bit register-register multiply: 700 ns@20 MHz (560 ns@25 MHz)
- $16 \div 8$ -bit register-register divide: 700 ns@20 MHz (560 ns@25 MHz)
- 16×16 -bit register-register multiply: 1.1 μ s@20 MHz (0.88 μ s@25 MHz)
- $32 \div 16$ -bit register-register divide: 1.1 μ s@20 MHz (0.88 μ s@25 MHz)
- Two CPU operating modes
 - Normal mode
 - Advanced mode
- Low-power mode
 - Transition to power-down state by SLEEP instruction

2.1.2 Differences from H8/300 CPU

In comparison to the H8/300 CPU, the H8/300H has the following enhancements.

- More general registers
 - Eight 16-bit registers have been added.
- Expanded address space
 - Advanced mode supports a maximum 16-Mbyte address space.
 - Normal mode supports the same 64-kbyte address space as the H8/300 CPU.
- Enhanced addressing
 - The addressing modes have been enhanced to make effective use of the 16-Mbyte address space.
- Enhanced instructions
 - Data transfer, arithmetic, and logic instructions can operate on 32-bit data.
 - Signed multiply/divide instructions and other instructions have been added.

2.2 CPU Operating Modes

The H8/300H CPU has two operating modes: normal and advanced. Normal mode supports a maximum 64-kbyte address space. Advanced mode supports up to 16 Mbytes.

Figure 2.1 CPU Operating Modes

2.3 Address Space

Figure 2.2 shows a simple memory map for the H8/3062 Group. The H8/300H CPU can address a linear address space with a maximum size of 64 kbytes in normal mode, and 16 Mbytes in advanced mode. For further details see section 3.6, Memory Map in Each Operating Mode.

The 1-Mbyte operating modes use 20-bit addressing. The upper 4 bits of effective addresses are ignored.

Figure 2.2 Memory Map

2.4 Register Configuration

2.4.1 Overview

The H8/300H CPU has the internal registers shown in figure 2.3. There are two types of registers: general registers and control registers.

Figure 2.3 CPU Registers

2.4.2 General Registers

The H8/300H CPU has eight 32-bit general registers. These general registers are all functionally alike and can be used without distinction between data registers and address registers. When a general register is used as a data register, it can be accessed as a 32-bit, 16-bit, or 8-bit register. When the general registers are used as 32-bit registers or as address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8-bit general registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum sixteen 8-bit registers.

Figure 2.4 illustrates the usage of the general registers. The usage of each register can be selected independently.

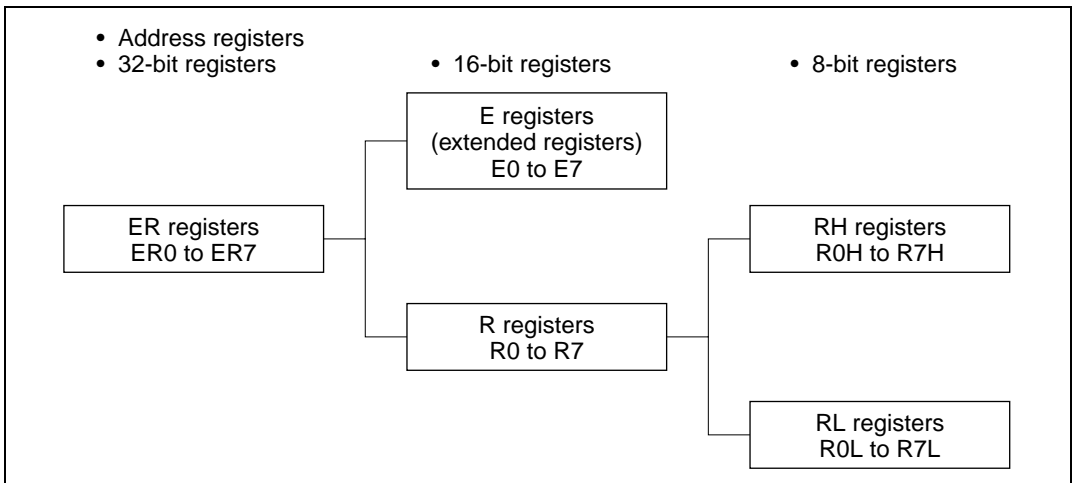

Figure 2.4 Usage of General Registers

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2.5 shows the stack.

Figure 2.5 Stack

2.4.3 Control Registers

The control registers are the 24-bit program counter (PC) and the 8-bit condition code register (CCR).

Program Counter (PC)

This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 2 bytes (one word), so the least significant PC bit is ignored. When an instruction is fetched, the least significant PC bit is regarded as 0.

Condition Code Register (CCR)

This 8-bit register contains internal CPU status information, including the interrupt mask bit (I) and half-carry (H), negative (N), zero (Z), overflow (V), and carry (C) flags.

Bit 7—Interrupt Mask Bit (I): Masks interrupts other than NMI when set to 1. NMI is accepted regardless of the I bit setting. The I bit is set to 1 at the start of an exception-handling sequence.

Bit 6—User Bit or Interrupt Mask Bit (UI): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. This bit can also be used as an interrupt mask bit. For details see section 5, Interrupt Controller.

Bit 5—Half-Carry Flag (H): When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3, and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 11, and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise.

Bit 4—User Bit (U): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions.

Bit 3—Negative Flag (N): Stores the value of the most significant bit of data, regarded as the sign bit.

Bit 2—Zero Flag (Z): Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data.

Bit 1—Overflow Flag (V): Set to 1 when an arithmetic overflow occurs, and cleared to 0 at other times.

Bit 0—Carry Flag (C): Set to 1 when a carry is generated by execution of an operation, and cleared to 0 otherwise. Used by:

- Add instructions, to indicate a carry
- Subtract instructions, to indicate a borrow
- Shift and rotate instructions

The carry flag is also used as a bit accumulator by bit manipulation instructions.

Some instructions leave flag bits unchanged. Operations can be performed on CCR by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used by conditional branch (Bcc) instructions.

For the action of each instruction on the flag bits, see appendix A.1, Instruction List. For the I and UI bits, see section 5, Interrupt Controller.

2.4.4 Initial CPU Register Values

In reset exception handling, PC is initialized to a value loaded from the vector table, and the I bit in CCR is set to 1. The other CCR bits and the general registers are not initialized. In particular, the initial value of the stack pointer (ER7) is also undefined. The stack pointer (ER7) must therefore be initialized by an MOV.L instruction executed immediately after a reset.

2.5 Data Formats

The H8/300H CPU can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1-bit data by accessing bit n ($n = 0, 1, 2, \dots, 7$) of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit BCD data.

2.5.1 General Register Data Formats

Figures 2.6 and 2.7 show the data formats in general registers.

Data Type	General Register	Data Format
1-bit data	RnH	
1-bit data	RnL	
4-bit BCD data	RnH	
4-bit BCD data	RnL	
Byte data	RnH	
Byte data	RnL	
Legend: RnH : General register RH RnL : General register RL		

Figure 2.6 General Register Data Formats

Figure 2.7 General Register Data Formats

2.5.2 Memory Data Formats

Figure 2.8 shows the data formats on memory. The H8/300H CPU can access word data and longword data on memory, but word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, no address error occurs but the least significant bit of the address is regarded as 0, so the access starts at the preceding address. This also applies to instruction fetches.

Figure 2.8 Memory Data Formats

When ER7 (SP) is used as an address register to access the stack, the operand size should be word size or longword size.

2.6 Instruction Set

2.6.1 Instruction Set Overview

The H8/300H CPU has 64 types of instructions, which are classified in table 2.1.

Table 2.1 Instruction Classification

Function	Instruction	Types
Data transfer	MOV, PUSH* ¹ , POP* ¹ , MOVTPE* ² , MOVFPE* ²	5
Arithmetic operations	ADD, SUB, ADDX, SUBX, INC, DEC, ADDS, SUBS, DAA, DAS, MULXU, MULXS, DIVXU, DIVXS, CMP, NEG, EXTS, EXTU	18
Logic operations	AND, OR, XOR, NOT	4
Shift operations	SHAL, SHAR, SHLL, SHLR, ROTL, ROTR, ROTXL, ROTXR	8
Bit manipulation	BSET, BCLR, BNOT, BTST, BAND, BIAND, BOR, BIOR, BXOR, BIXOR, BLD, BILD, BST, BIST	14
Branch	Bcc* ³ , JMP, BSR, JSR, RTS	5
System control	TRAPA, RTE, SLEEP, LDC, STC, ANDC, ORC, XORC, NOP	9
Block data transfer	EEPMOV	1

Total 64 types

- Notes: 1. POP.W Rn is identical to MOV.W @SP+, Rn.
 PUSH.W Rn is identical to MOV.W Rn, @-SP.
 POP.L ERn is identical to MOV.L @SP+, Rn.
 PUSH.L ERn is identical to MOV.L Rn, @-SP.
2. Not available in the H8/3062 Group.
3. Bcc is a generic branching instruction.

2.6.2 Instructions and Addressing Modes

Table 2.2 indicates the instructions available in the H8/300H CPU.

Table 2.2 Instructions and Addressing Modes

Function	Instruction	Addressing Modes

2.6.3 Tables of Instructions Classified by Function

Tables 2.3 to 2.10 summarize the instructions in each functional category. The operation notation used in these tables is defined next.

Operation Notation

Rd	General register (destination)*
Rs	General register (source)*
Rn	General register*
ERn	General register (32-bit register or address register)*
(EAd)	Destination operand
(EAs)	Source operand
CCR	Condition code register
N	N (negative) flag of CCR
Z	Z (zero) flag of CCR
V	V (overflow) flag of CCR
C	C (carry) flag of CCR
PC	Program counter
SP	Stack pointer
#IMM	Immediate data
disp	Displacement
+	Addition
−	Subtraction
×	Multiplication
÷	Division
^	AND logical
∨	OR logical
⊕	Exclusive OR logical
→	Move
¬	NOT (logical complement)
:3/:8/:16/:24	3-, 8-, 16-, or 24-bit length

Note: * General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit data or address registers (ER0 to ER7).

Table 2.3 Data Transfer Instructions

Instruction	Size*	Function
MOV	B/W/L	(EAs) → Rd, Rs → (EAd) Moves data between two general registers or between a general register and memory, or moves immediate data to a general register.
MOVFPE	B	(EAs) → Rd Cannot be used in the H8/3062 Group.
MOVTPE	B	Rs → (EAs) Cannot be used in the H8/3062 Group.
POP	W/L	@SP+ → Rn Pops a general register from the stack. POP.W Rn is identical to MOV.W @SP+, Rn. Similarly, POP.L ERn is identical to MOV.L @SP+, ERn.
PUSH	W/L	Rn → @-SP Pushes a general register onto the stack. PUSH.W Rn is identical to MOV.W Rn, @-SP. Similarly, PUSH.L ERn is identical to MOV.L ERn, @-SP.

Note: * Size refers to the operand size.

B : Byte

W: Word

L : Longword

Table 2.4 Arithmetic Operation Instructions

Instruction	Size*	Function
ADD,SUB	B/W/L	$Rd \pm Rs \rightarrow Rd, Rd \pm \#IMM \rightarrow Rd$ Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register. (Immediate byte data cannot be subtracted from data in a general register. Use the SUBX or ADD instruction.)
ADDX, SUBX	B	$Rd \pm Rs \pm C \rightarrow Rd, Rd \pm \#IMM \pm C \rightarrow Rd$ Performs addition or subtraction with carry or borrow on data in two general registers, or on immediate data and data in a general register.
INC, DEC	B/W/L	$Rd \pm 1 \rightarrow Rd, Rd \pm 2 \rightarrow Rd$ Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.)
ADDS, SUBS	L	$Rd \pm 1 \rightarrow Rd, Rd \pm 2 \rightarrow Rd, Rd \pm 4 \rightarrow Rd$ Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register.
DAA, DAS	B	$Rd \text{ decimal adjust} \rightarrow Rd$ Decimal-adjusts an addition or subtraction result in a general register by referring to CCR to produce 4-bit BCD data.
MULXU	B/W	$Rd \times Rs \rightarrow Rd$ Performs unsigned multiplication on data in two general registers: either 8 bits \times 8 bits \rightarrow 16 bits or 16 bits \times 16 bits \rightarrow 32 bits.
MULXS	B/W	$Rd \times Rs \rightarrow Rd$ Performs signed multiplication on data in two general registers: either 8 bits \times 8 bits \rightarrow 16 bits or 16 bits \times 16 bits \rightarrow 32 bits.

Instruction	Size*	Function
DIVXU	B/W	$Rd \div Rs \rightarrow Rd$ Performs unsigned division on data in two general registers: either 16 bits \div 8 bits \rightarrow 8-bit quotient and 8-bit remainder or 32 bits \div 16 bits \rightarrow 16-bit quotient and 16-bit remainder
DIVXS	B/W	$Rd \div Rs \rightarrow Rd$ Performs signed division on data in two general registers: either 16 bits \div 8 bits \rightarrow 8-bit quotient and 8-bit remainder, or 32 bits \div 16 bits \rightarrow 16-bit quotient and 16-bit remainder
CMP	B/W/L	$Rd - Rs, Rd - \#IMM$ Compares data in a general register with data in another general register or with immediate data, and sets CCR according to the result.
NEG	B/W/L	$0 - Rd \rightarrow Rd$ Takes the two's complement (arithmetic complement) of data in a general register.
EXTS	W/L	Rd (sign extension) $\rightarrow Rd$ Extends byte data in the lower 8 bits of a 16-bit register to word data, or extends word data in the lower 16 bits of a 32-bit register to longword data, by extending the sign bit.
EXTU	W/L	Rd (zero extension) $\rightarrow Rd$ Extends byte data in the lower 8 bits of a 16-bit register to word data, or extends word data in the lower 16 bits of a 32-bit register to longword data, by padding with zeros.

Note: * Size refers to the operand size.

B : Byte

W : Word

L : Longword

Table 2.5 Logic Operation Instructions

Instruction	Size*	Function
AND	B/W/L	$Rd \wedge Rs \rightarrow Rd$, $Rd \wedge \#IMM \rightarrow Rd$ Performs a logical AND operation on a general register and another general register or immediate data.
OR	B/W/L	$Rd \vee Rs \rightarrow Rd$, $Rd \vee \#IMM \rightarrow Rd$ Performs a logical OR operation on a general register and another general register or immediate data.
XOR	B/W/L	$Rd \oplus Rs \rightarrow Rd$, $Rd \oplus \#IMM \rightarrow Rd$ Performs a logical exclusive OR operation on a general register and another general register or immediate data.
NOT	B/W/L	$\neg Rd \rightarrow Rd$ Takes the one's complement (logical complement) of general register contents.

Note: * Size refers to the operand size.

B : Byte

W : Word

L : Longword

Table 2.6 Shift Instructions

Instruction	Size*	Function
SHAL, SHAR	B/W/L	$Rd \text{ (shift)} \rightarrow Rd$ Performs an arithmetic shift on general register contents.
SHLL, SHLR	B/W/L	$Rd \text{ (shift)} \rightarrow Rd$ Performs a logical shift on general register contents.
ROTL, ROTR	B/W/L	$Rd \text{ (rotate)} \rightarrow Rd$ Rotates general register contents.
ROTXL, ROTXR	B/W/L	$Rd \text{ (rotate)} \rightarrow Rd$ Rotates general register contents, including the carry bit.

Note: * Size refers to the operand size.

B : Byte

W : Word

L : Longword

Table 2.7 Bit Manipulation Instructions

Instruction	Size*	Function
BSET	B	$1 \rightarrow (\text{<bit-No.> of <EAd>})$ Sets a specified bit in a general register or memory operand to 1. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BCLR	B	$0 \rightarrow (\text{<bit-No.> of <EAd>})$ Clears a specified bit in a general register or memory operand to 0. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BNOT	B	$\neg (\text{<bit-No.> of <EAd>}) \rightarrow (\text{<bit-No.> of <EAd>})$ Inverts a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BTST	B	$\neg (\text{<bit-No.> of <EAd>}) \rightarrow Z$ Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BAND	B	$C \wedge (\text{<bit-No.> of <EAd>}) \rightarrow C$ ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BIAND	B	$C \wedge [\neg (\text{<bit-No.> of <EAd>})] \rightarrow C$ ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.

Instruction	Size*	Function
BOR	B	$C \vee \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$ ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BIOR	B	$C \vee [\neg \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle] \rightarrow C$ ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BXOR	B	$C \oplus \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$ Exclusive-ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BIXOR	B	$C \oplus [\neg \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle] \rightarrow C$ Exclusive-ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BLD	B	$\langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$ Transfers a specified bit in a general register or memory operand to the carry flag. The bit number is specified by 3-bit immediate data.
BILD	B	$\neg \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$ Transfers the inverse of a specified bit in a general register or memory operand to the carry flag. The bit number is specified by 3-bit immediate data.
BST	B	$C \rightarrow \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle$ Transfers the carry flag value to a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data.
BIST	B	$C \rightarrow \neg \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle$ Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data.

Note: * Size refers to the operand size.

B : Byte

Table 2.8 Branching Instructions

Instruction	Size	Function																																																			
Bcc	—	Branches to a specified address if address specified condition is met. The branching conditions are listed below.																																																			
		<table border="1"> <thead> <tr> <th>Mnemonic</th> <th>Description</th> <th>Condition</th> </tr> </thead> <tbody> <tr> <td>BRA (BT)</td> <td>Always (true)</td> <td>Always</td> </tr> <tr> <td>BRN (BF)</td> <td>Never (false)</td> <td>Never</td> </tr> <tr> <td>BHI</td> <td>High</td> <td>$C \vee Z = 0$</td> </tr> <tr> <td>BLS</td> <td>Low or same</td> <td>$C \vee Z = 1$</td> </tr> <tr> <td>Bcc (BHS)</td> <td>Carry clear (high or same)</td> <td>$C = 0$</td> </tr> <tr> <td>BCS (BLO)</td> <td>Carry set (low)</td> <td>$C = 1$</td> </tr> <tr> <td>BNE</td> <td>Not equal</td> <td>$Z = 0$</td> </tr> <tr> <td>BEQ</td> <td>Equal</td> <td>$Z = 1$</td> </tr> <tr> <td>BVC</td> <td>Overflow clear</td> <td>$V = 0$</td> </tr> <tr> <td>BVS</td> <td>Overflow set</td> <td>$V = 1$</td> </tr> <tr> <td>BPL</td> <td>Plus</td> <td>$N = 0$</td> </tr> <tr> <td>BMI</td> <td>Minus</td> <td>$N = 1$</td> </tr> <tr> <td>BGE</td> <td>Greater or equal</td> <td>$N \oplus V = 0$</td> </tr> <tr> <td>BLT</td> <td>Less than</td> <td>$N \oplus V = 1$</td> </tr> <tr> <td>BGT</td> <td>Greater than</td> <td>$Z \vee (N \oplus V) = 0$</td> </tr> <tr> <td>BLE</td> <td>Less or equal</td> <td>$Z \vee (N \oplus V) = 1$</td> </tr> </tbody> </table>	Mnemonic	Description	Condition	BRA (BT)	Always (true)	Always	BRN (BF)	Never (false)	Never	BHI	High	$C \vee Z = 0$	BLS	Low or same	$C \vee Z = 1$	Bcc (BHS)	Carry clear (high or same)	$C = 0$	BCS (BLO)	Carry set (low)	$C = 1$	BNE	Not equal	$Z = 0$	BEQ	Equal	$Z = 1$	BVC	Overflow clear	$V = 0$	BVS	Overflow set	$V = 1$	BPL	Plus	$N = 0$	BMI	Minus	$N = 1$	BGE	Greater or equal	$N \oplus V = 0$	BLT	Less than	$N \oplus V = 1$	BGT	Greater than	$Z \vee (N \oplus V) = 0$	BLE	Less or equal	$Z \vee (N \oplus V) = 1$
Mnemonic	Description	Condition																																																			
BRA (BT)	Always (true)	Always																																																			
BRN (BF)	Never (false)	Never																																																			
BHI	High	$C \vee Z = 0$																																																			
BLS	Low or same	$C \vee Z = 1$																																																			
Bcc (BHS)	Carry clear (high or same)	$C = 0$																																																			
BCS (BLO)	Carry set (low)	$C = 1$																																																			
BNE	Not equal	$Z = 0$																																																			
BEQ	Equal	$Z = 1$																																																			
BVC	Overflow clear	$V = 0$																																																			
BVS	Overflow set	$V = 1$																																																			
BPL	Plus	$N = 0$																																																			
BMI	Minus	$N = 1$																																																			
BGE	Greater or equal	$N \oplus V = 0$																																																			
BLT	Less than	$N \oplus V = 1$																																																			
BGT	Greater than	$Z \vee (N \oplus V) = 0$																																																			
BLE	Less or equal	$Z \vee (N \oplus V) = 1$																																																			
JMP	—	Branches unconditionally to a specified address.																																																			
BSR	—	Branches to a subroutine at a specified address.																																																			
JSR	—	Branches to a subroutine at a specified address.																																																			
RTS	—	Returns from a subroutine.																																																			

Table 2.9 System Control Instructions

Instruction	Size*	Function
TRAPA	—	Starts trap-instruction exception handling.
RTE	—	Returns from an exception-handling routine.
SLEEP	—	Causes a transition to the power-down state.
LDC	B/W	(EAs) → CCR Moves the source operand contents to the condition code register. The condition code register size is one byte, but in transfer from memory, data is read by word access.
STC	B/W	CCR → (EAd) Transfers the CCR contents to a destination location. The condition code register size is one byte, but in transfer to memory, data is written by word access.
ANDC	B	CCR ∧ #IMM → CCR Logically ANDs the condition code register with immediate data.
ORC	B	CCR ∨ #IMM → CCR Logically ORs the condition code register with immediate data.
XORC	B	CCR ⊕ #IMM → CCR Logically exclusive-ORs the condition code register with immediate data.
NOP	—	PC + 2 → PC Only increments the program counter.

Note: * Size refers to the operand size.

B : Byte

W: Word

Table 2.10 Block Transfer Instruction

Instruction	Size	Function
EEPMOV.B	—	if R4L \neq 0 then repeat @ER5+ \rightarrow @ER6+, R4L - 1 \rightarrow R4L until R4L = 0 else next;
EEPMOV.W	—	if R4 \neq 0 then repeat @ER5+ \rightarrow @ER6+, R4 - 1 \rightarrow R4 until R4 = 0 else next; Block transfer instruction. This instruction transfers the number of data bytes specified by R4L or R4, starting from the address indicated by ER5, to the location starting at the address indicated by ER6. At the end of the transfer, the next instruction is executed.

2.6.4 Basic Instruction Formats

The H8/300H instructions consist of 2-byte (word) units. An instruction consists of an operation field (OP field), a register field (r field), an effective address extension (EA field), and a condition field (cc).

Operation Field: Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first 4 bits of the instruction. Some instructions have two operation fields.

Register Field: Specifies a general register. Address registers are specified by 3 bits, data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.

Effective Address Extension: 8, 16, or 32 bits specifying immediate data, an absolute address, or a displacement. A 24-bit address or displacement is treated as 32-bit data in which the first 8 bits are 0 (H'00).

Condition Field: Specifies the branching condition of Bcc instructions.

Figure 2.9 shows examples of instruction formats.

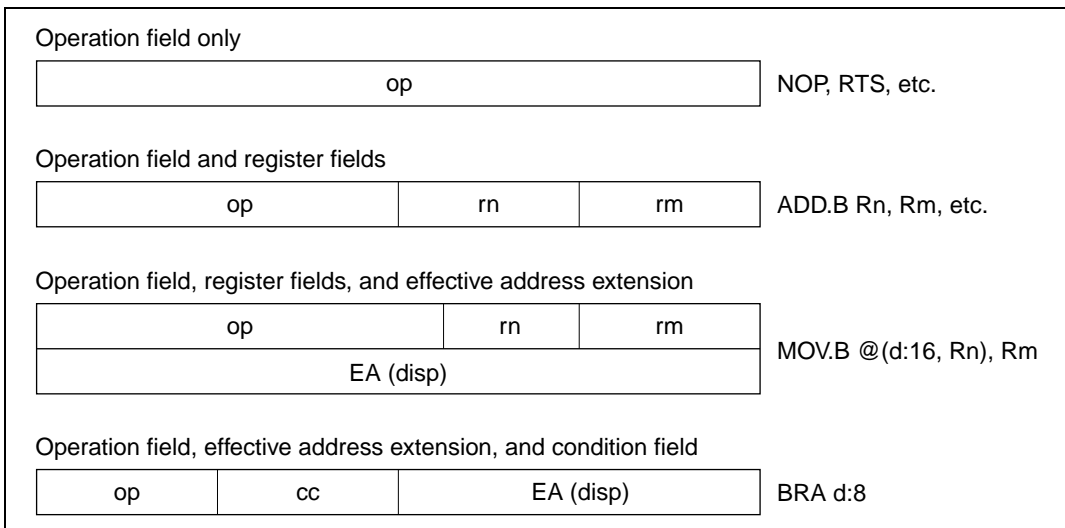

Figure 2.9 Instruction Formats

2.6.5 Notes on Use of Bit Manipulation Instructions

The BSET, BCLR, BNOT, BST, and BIST instructions read a byte of data, modify a bit in the byte, then write the byte back. Care is required when these instructions are used to access registers with write-only bits, or to access ports.

Step		Description
1	Read	Read one data byte at the specified address
2	Modify	Modify one bit in the data byte
3	Write	Write the modified data byte back to the specified address

Example 1: BCLR is executed to clear bit 0 in the port 4 data direction register (P4DDR) under the following conditions.

P4₇, P4₆: Input pins
P4₅ – P4₀: Output pins

The intended purpose of this BCLR instruction is to switch P4₀ from output to input.

Before Execution of BCLR Instruction

	P4 ₇	P4 ₆	P4 ₅	P4 ₄	P4 ₃	P4 ₂	P4 ₁	P4 ₀
Input/output	Input	Input	Output	Output	Output	Output	Output	Output
DDR	0	0	1	1	1	1	1	1

Execution of BCLR Instruction

BCLR #0, P4DDR ; Execute BCLR instruction on DDR

After Execution of BCLR Instruction

	P4 ₇	P4 ₆	P4 ₅	P4 ₄	P4 ₃	P4 ₂	P4 ₁	P4 ₀
Input/output	Output	Output	Output	Output	Output	Output	Output	Input
DDR	1	1	1	1	1	1	1	0

Explanation: To execute the BCLR instruction, the CPU begins by reading P4DDR. Since P4DDR is a write-only register, it is read as H'FF, even though its true value is H'3F.

Next the CPU clears bit 0 of the read data, changing the value to H'FE.

Finally, the CPU writes this value (H'FE) back to P4DDR to complete the BCLR instruction.

As a result, P4₀DDR is cleared to 0, making P4₀ an input pin. In addition, P4₇DDR and P4₆DDR are set to 1, making P4₇ and P4₆ output pins.

The BCLR instruction can be used to clear flags in the on-chip registers to 0. In the case of the IRQ status register (ISR), for example, a flag must be read as a condition for clearing it, but when using the BCLR instruction, if it is known that a flag has been set to 1 in an interrupt-handling routine, for instance, it is not necessary to read the flag ahead of time.

2.7 Addressing Modes and Effective Address Calculation

2.7.1 Addressing Modes

The H8/300H CPU supports the eight addressing modes listed in table 2.11. Each instruction uses a subset of these addressing modes. Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit manipulation instructions use register direct, register indirect, or absolute (@aa:8) addressing mode to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

Table 2.11 Addressing Modes

No.	Addressing Mode	Symbol
1	Register direct	Rn
2	Register indirect	@ERn
3	Register indirect with displacement	@(d:16, ERn)/@(d:24, ERn)
4	Register indirect with post-increment Register indirect with pre-decrement	@ERn+ @-ERn
5	Absolute address	@aa:8/@aa:16/@aa:24
6	Immediate	#xx:8/#xx:16/#xx:32
7	Program-counter relative	@(d:8, PC)/@(d:16, PC)
8	Memory indirect	@@aa:8

1. Register Direct—Rn: The register field of the instruction code specifies an 8-, 16-, or 32-bit register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16-bit registers. ER0 to ER7 can be specified as 32-bit registers.

2. Register Indirect—@ERn: The register field of the instruction code specifies an address register (ERn), the lower 24 bits of which contain the address of the operand.

3. Register Indirect with Displacement—@(d:16, ERn) or @(d:24, ERn): A 16-bit or 24-bit displacement contained in the instruction code is added to the contents of an address register (ERn) specified by the register field of the instruction, and the lower 24 bits of the sum specify the address of a memory operand. A 16-bit displacement is sign-extended when added.

4. Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @-ERn:

- Register indirect with post-increment—@ERn+
The register field of the instruction code specifies an address register (ERn) the lower 24 bits of which contain the address of a memory operand. After the operand is accessed, 1, 2, or 4 is added to the address register contents (32 bits) and the sum is stored in the address register. The value added is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the register value should be even.
- Register indirect with pre-decrement—@-ERn
The value 1, 2, or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the lower 24 bits of the result become the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the resulting register value should be even.

5. Absolute Address—@aa:8, @aa:16, or @aa:24: The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long (@aa:8), 16 bits long (@aa:16), or 24 bits long (@aa:24). For an 8-bit absolute address, the upper 16 bits are all assumed to be 1 (H'FFFF). For a 16-bit absolute address the upper 8 bits are a sign extension. A 24-bit absolute address can access the entire address space. Table 2.12 indicates the accessible address ranges.

Table 2.12 Absolute Address Access Ranges

Absolute Address	1-Mbyte Modes	16-Mbyte Modes
8 bits (@aa:8)	H'FFF00 to H'FFFFF (1048320 to 1048575)	H'FFFFF00 to H'FFFFFFF (16776960 to 16777215)
16 bits (@aa:16)	H'00000 to H'07FFF, H'F8000 to H'FFFFF (0 to 32767, 1015808 to 1048575)	H'000000 to H'007FFF, H'FF8000 to H'FFFFFFF (0 to 32767, 16744448 to 16777215)
24 bits (@aa:24)	H'00000 to H'FFFFF (0 to 1048575)	H'000000 to H'FFFFFFF (0 to 16777215)

6. Immediate—#xx:8, #xx:16, or #xx:32: The instruction code contains 8-bit (#xx:8), 16-bit (#xx:16), or 32-bit (#xx:32) immediate data as an operand.

The instruction codes of the ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. The instruction codes of some bit manipulation instructions contain 3-bit immediate data specifying a bit number. The TRAPA instruction code contains 2-bit immediate data specifying a vector address.

7. Program-Counter Relative—@(d**:8, PC) or @(**d**:16, PC):** This mode is used in the Bcc and BSR instructions. An 8-bit or 16-bit displacement contained in the instruction code is sign-extended to 24 bits and added to the 24-bit PC contents to generate a 24-bit branch address. The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is -126 to $+128$ bytes (-63 to $+64$ words) or -32766 to $+32768$ bytes (-16383 to $+16384$ words) from the branch instruction. The resulting value should be an even number.

8. Memory Indirect—@@aa**:8:** This mode can be used by the JMP and JSR instructions. The instruction code contains an 8-bit absolute address specifying a memory operand. This memory operand contains a branch address. The memory operand is accessed by longword access. The first byte of the memory operand is ignored, generating a 24-bit branch address. See figure 2.10. The upper bits of the 8-bit absolute address are assumed to be 0 (H'0000), so the address range is 0 to 255 (H'000000 to H'0000FF). Note that the first part of this range is also the exception vector area. For further details see section 5, Interrupt Controller.

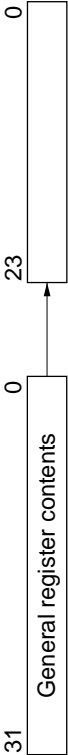

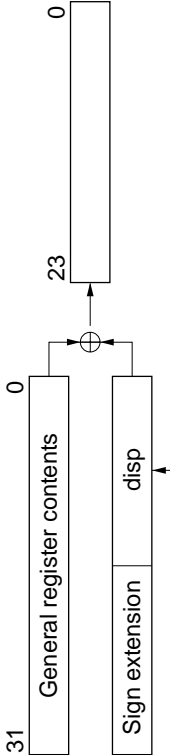

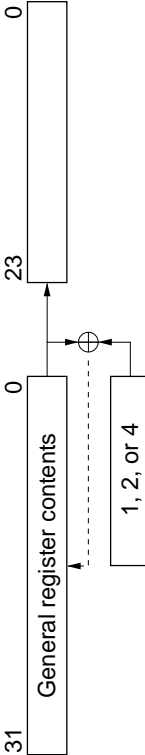

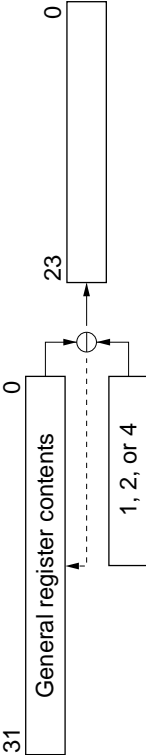

Figure 2.10 Memory-Indirect Branch Address Specification

When a word-size or longword-size memory operand is specified, or when a branch address is specified, if the specified memory address is odd, the least significant bit is regarded as 0. The accessed data or instruction code therefore begins at the preceding address. See section 2.5.2, Memory Data Formats.

2.7.2 Effective Address Calculation

Table 2.13 explains how an effective address is calculated in each addressing mode. In the 1-Mbyte operating modes the upper 4 bits of the calculated address are ignored in order to generate a 20-bit effective address.

Table 2.13 Effective Address Calculation

No.	Addressing Mode and Instruction Format	Effective Address Calculation	Effective Address
1	Register direct (Rn) 		Operand is general register contents
2	Register indirect (@ERn) 		
3	Register indirect with displacement @d:16, ERn)/@:(d:24, ERn) 		
4	Register indirect with post-increment or pre-decrement		
	Register indirect with post-increment @ERn+ 		
	Register indirect with pre-decrement @-ERn

2.8 Processing States

2.8.1 Overview

The H8/300H CPU has five processing states: the program execution state, exception-handling state, power-down state, reset state, and bus-released state. The power-down state includes sleep mode, software standby mode, and hardware standby mode. Figure 2.11 classifies the processing states. Figure 2.13 indicates the state transitions.

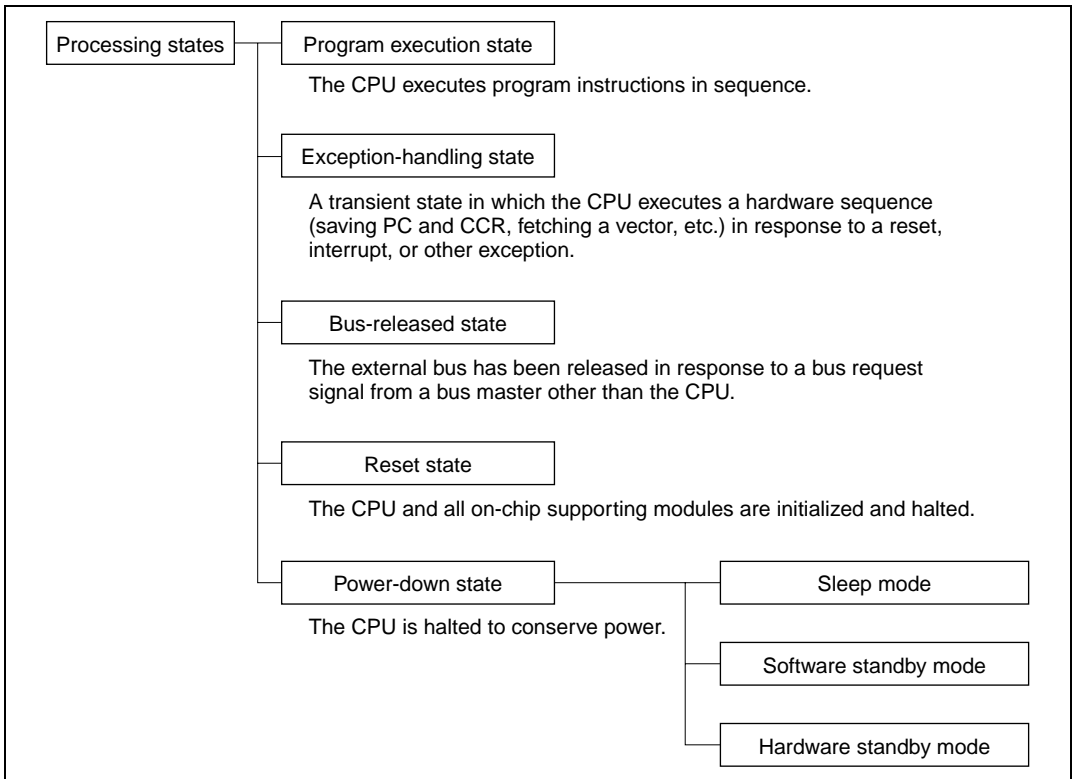

Figure 2.11 Processing States

2.8.2 Program Execution State

In this state the CPU executes program instructions in normal sequence.

2.8.3 Exception-Handling State

The exception-handling state is a transient state that occurs when the CPU alters the normal program flow due to a reset, interrupt, or trap instruction. The CPU fetches a starting address from the exception vector table and branches to that address. In interrupt and trap exception handling the CPU refers to the stack pointer (ER7) and saves the program counter and condition code register.

Types of Exception Handling and Their Priority: Exception handling is performed for resets, interrupts, and trap instructions. Table 2.14 indicates the types of exception handling and their priority. Trap instruction exceptions are accepted at all times in the program execution state.

Table 2.14 Exception Handling Types and Priority

Priority	Type of Exception	Detection Timing	Start of Exception Handling
High ↑ Low	Reset	Synchronized with clock	Exception handling starts immediately when \overline{RES} changes from low to high
	Interrupt	End of instruction execution or end of exception handling*	When an interrupt is requested, exception handling starts at the end of the current instruction or current exception-handling sequence
	Trap instruction	When TRAPA instruction is executed	Exception handling starts when a trap (TRAPA) instruction is executed

Note: * Interrupts are not detected at the end of the ANDC, ORC, XORC, and LDC instructions, or immediately after reset exception handling.

Figure 2.12 classifies the exception sources. For further details about exception sources, vector numbers, and vector addresses, see section 4, Exception Handling, and section 5, Interrupt Controller.

Figure 2.12 Classification of Exception Sources

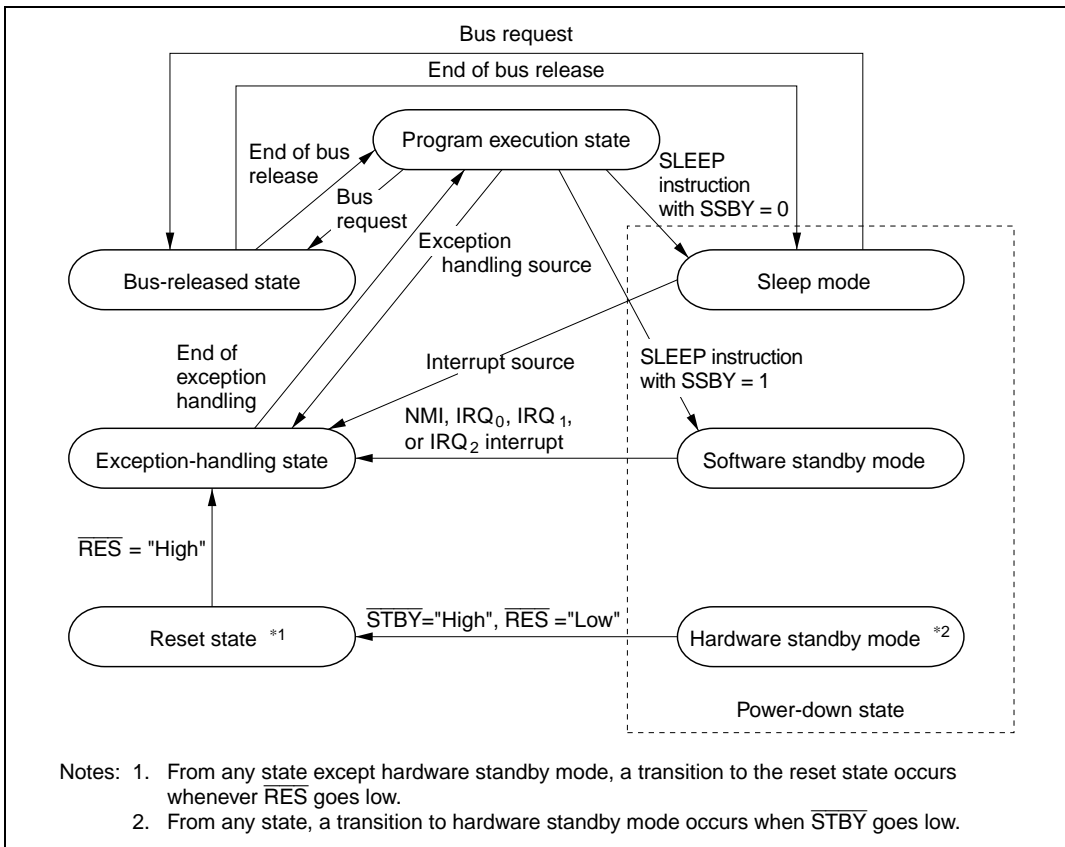

Figure 2.13 State Transitions

2.8.4 Exception Handling Operation

Reset Exception Handling: Reset exception handling has the highest priority. The reset state is entered when the \overline{RES} signal goes low. Reset exception handling starts after that, when \overline{RES} changes from low to high. When reset exception handling starts the CPU fetches a start address from the exception vector table and starts program execution from that address. All interrupts, including NMI, are disabled during the reset exception-handling sequence and immediately after it ends.

Interrupt Exception Handling and Trap Instruction Exception Handling: When these exception-handling sequences begin, the CPU references the stack pointer (ER7) and pushes the program counter and condition code register on the stack. Next, if the UE bit in the system control register (SYSCR) is set to 1, the CPU sets the I bit in the condition code register to 1. If the UE bit

is cleared to 0, the CPU sets both the I bit and the UI bit in the condition code register to 1. Then the CPU fetches a start address from the exception vector table and execution branches to that address.

Figure 2.14 shows the stack after the exception-handling sequence.

Figure 2.14 Stack Structure after Exception Handling

2.8.5 Bus-Released State

In this state the bus is released to a bus master other than the CPU, in response to a bus request. The bus masters other than the CPU is an external bus master. While the bus is released, the CPU halts except for internal operations. Interrupt requests are not accepted. For details see section 6.6, Bus Arbiter.

2.8.6 Reset State

When the $\overline{\text{RES}}$ input goes low all current processing stops and the CPU enters the reset state. The I bit in the condition code register is set to 1 by a reset. All interrupts are masked in the reset state. Reset exception handling starts when the $\overline{\text{RES}}$ signal changes from low to high.

The reset state can also be entered by a watchdog timer overflow. For details see section 11, Watchdog Timer.

2.8.7 Power-Down State

In the power-down state the CPU stops operating to conserve power. There are three modes: sleep mode, software standby mode, and hardware standby mode.

Sleep Mode: A transition to sleep mode is made if the SLEEP instruction is executed while the SSBY bit is cleared to 0 in the system control register (SYSCR). CPU operations stop immediately after execution of the SLEEP instruction, but the contents of CPU registers are retained.

Software Standby Mode: A transition to software standby mode is made if the SLEEP instruction is executed while the SSBY bit is set to 1 in SYSCR. The CPU and clock halt and all on-chip supporting modules stop operating. The on-chip supporting modules are reset, but as long as a specified voltage is supplied the contents of CPU registers and on-chip RAM are retained. The I/O ports also remain in their existing states.

Hardware Standby Mode: A transition to hardware standby mode is made when the $\overline{\text{STBY}}$ input goes low. As in software standby mode, the CPU and all clocks halt and the on-chip supporting modules are reset, but as long as a specified voltage is supplied, on-chip RAM contents are retained.

For further information see section 21, Power-Down State.

2.9 Basic Operational Timing

2.9.1 Overview

The H8/300H CPU operates according to the system clock (ϕ). The interval from one rise of the system clock to the next rise is referred to as a “state.” A memory cycle or bus cycle consists of two or three states. The CPU uses different methods to access on-chip memory, the on-chip supporting modules, and the external address space. Access to the external address space can be controlled by the bus controller.

2.9.2 On-Chip Memory Access Timing

On-chip memory is accessed in two states. The data bus is 16 bits wide, permitting both byte and word access. Figure 2.15 shows the on-chip memory access cycle. Figure 2.16 indicates the pin states.

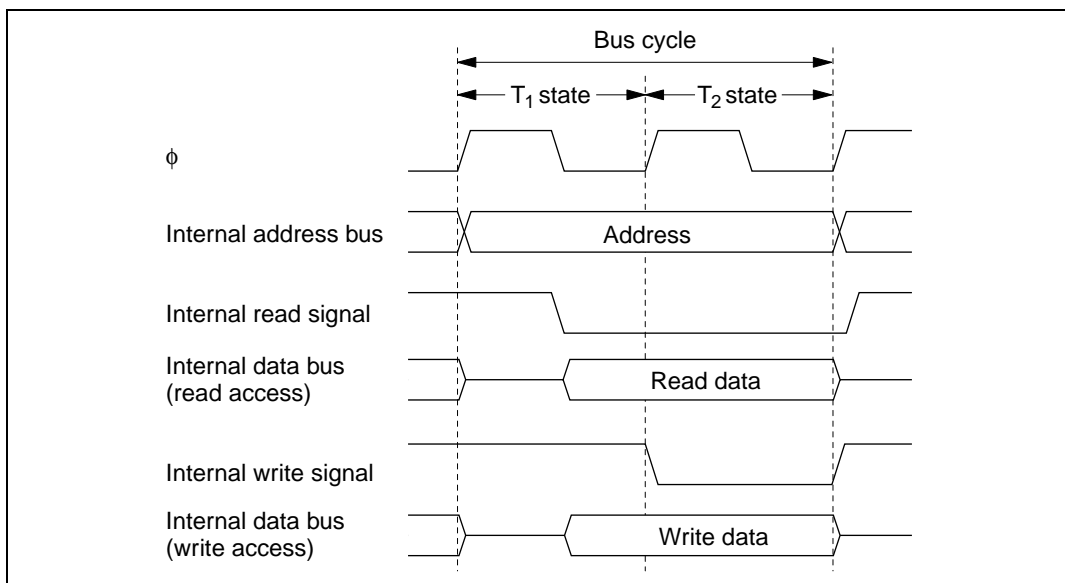

Figure 2.15 On-Chip Memory Access Cycle

Figure 2.16 Pin States during On-Chip Memory Access (Address Update Mode 1)

2.9.3 On-Chip Supporting Module Access Timing

The on-chip supporting modules are accessed in three states. The data bus is 8 or 16 bits wide, depending on the internal I/O register being accessed. Figure 2.17 shows the on-chip supporting module access timing. Figure 2.18 indicates the pin states.

Figure 2.17 Access Cycle for On-Chip Supporting Modules

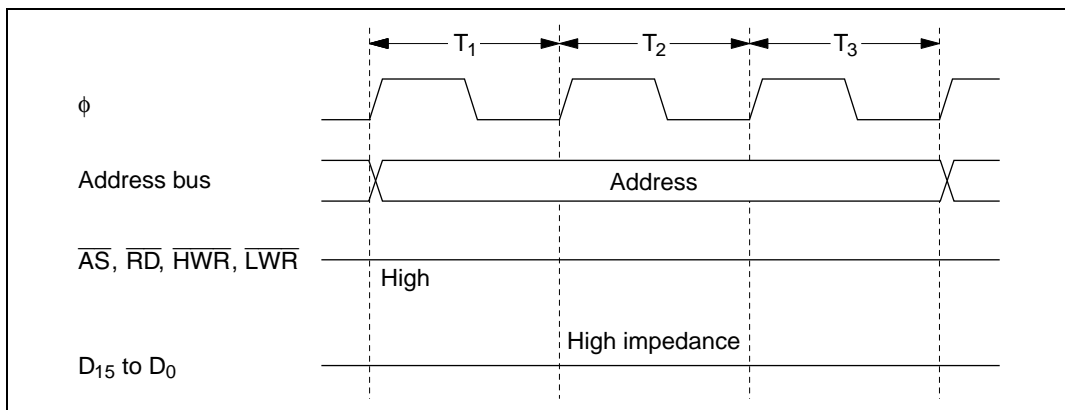

Figure 2.18 Pin States during Access to On-Chip Supporting Modules

2.9.4 Access to External Address Space

The external address space is divided into eight areas (areas 0 to 7). Bus-controller settings determine whether each area is accessed via an 8-bit or 16-bit data bus, and whether it is accessed in two or three states. For details see section 6, Bus Controller.

Section 3 MCU Operating Modes

3.1 Overview

3.1.1 Operating Mode Selection

The H8/3062 Group has seven operating modes (modes 1 to 7) that are selected by the mode pins (MD₂ to MD₀) as indicated in table 3.1. The input at these pins determines the size of the address space and the initial bus mode.

Table 3.1 Operating Mode Selection

Operating Mode	Mode Pins			Address Space	Description		
	MD ₂	MD ₁	MD ₀		Initial Bus Mode* ¹	On-Chip ROM	On-Chip RAM
—	0	0	0	Setting prohibited	Setting prohibited	Setting prohibited	Setting prohibited
Mode 1	0	0	1	Expanded mode	8 bits	Disabled	Enabled ^{1*2}
Mode 2	0	1	0	Expanded mode	16 bits	Disabled	Enabled ^{1*2}
Mode 3	0	1	1	Expanded mode	8 bits	Disabled	Enabled ^{1*2}
Mode 4	1	0	0	Expanded mode	16 bits	Disabled	Enabled ^{1*2}
Mode 5	1	0	1	Expanded mode	8 bits	Enabled	Enabled ^{1*2}
Mode 6	1	1	0	Single-chip normal mode	—	Enabled	Enabled
Mode 7	1	1	1	Single-chip advanced mode	—	Enabled	Enabled

- Notes: 1. In modes 1 to 5, an 8-bit or 16-bit data bus can be selected on a per-area basis by settings made in the area bus width control register (ABWCR). For details see section 6, Bus Controller.
2. If the RAME bit in SYSCR is cleared to 0, these addresses become external addresses.

For the address space size there are three choices: 64 kbytes, 1 Mbyte, or 16 Mbyte. The external data bus is either 8 or 16 bits wide depending on ABWCR settings. 8-bit bus mode is used only if 8-bit access is selected for all areas. For details see section 6, Bus Controller.

Modes 1 to 4 are externally expanded modes that enable access to external memory and peripheral devices and disable access to the on-chip ROM. Modes 1 and 2 support a maximum address space of 1 Mbyte. Modes 3 and 4 support a maximum address space of 16 Mbytes.

Mode 5 is an externally expanded mode that enables access to external memory and peripheral devices and also enables access to the on-chip ROM. Mode 5 supports a maximum address space of 16 Mbytes.

Modes 6 and 7 are single-chip modes in which the chip operates using only the on-chip ROM, RAM, and I/O registers. All ports are available in these modes. Mode 6 supports a maximum address space of 64 kbytes. Mode 7 supports a maximum address space of 1 Mbyte.

The H8/3062 Group can be used only in modes 1 to 7. The inputs at the mode pins must select one of these seven modes. The inputs at the mode pins must not be changed during operation. Set the reset state before changing the inputs at these pins.

3.1.2 Register Configuration

The H8/3062 Group has a mode control register (MDCR) that indicates the inputs at the mode pins (MD_2 to MD_0), and a system control register (SYSCR). Table 3.2 summarizes these registers.

Table 3.2 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'EE011	Mode control register	MDCR	R	Undetermined
H'EE012	System control register	SYSCR	R/W	H'09

Note: * Lower 20 bits of the address in advanced mode.

3.2 Mode Control Register (MDCR)

MDCR is an 8-bit read-only register that indicates the current operating mode of the H8/3062 Group.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	MDS2	MDS1	MDS0
Initial value	1	1	0	0	0	—*	—*	—*
Read/Write	—	—	—	—	—	R	R	R

Reserved bits
Mode select 2 to 0
Bits indicating the current operating mode

Note: * Determined by pins MD₂ to MD₀.

Bits 7 and 6—Reserved: These bits can not be modified and are always read as 1.

Bits 5 to 3—Reserved: These bits can not be modified and are always read as 0.

Bits 2 to 0—Mode Select 2 to 0 (MDS2 to MDS0): These bits indicate the logic levels at pins MD₂ to MD₀ (the current operating mode). MDS2 to MDS0 correspond to MD₂ to MD₀. MDS2 to MDS0 are read-only bits. The mode pin (MD₂ to MD₀) levels are latched into these bits when MDCR is read.

Note: The versions with on-chip flash memory have a boot mode in which flash memory can be programmed. In boot mode, the MDS2 bit value is the inverse of the level at the MD₂ pin.

3.3 System Control Register (SYSCR)

SYSCR is an 8-bit register that controls the operation of the H8/3062 Group.

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	SSOE	RAME
Initial value	0	0	0	0	1	0	0	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

RAM enable
Enables or disables on-chip RAM

Software standby output port enable
Selects the output state of the address bus and bus control signals in software standby mode

NMI edge select
Selects the valid edge of the NMI input

User bit enable
Selects whether to use the UI bit in CCR as a user bit or an interrupt mask bit

Standby timer select 2 to 0
These bits select the waiting time at recovery from software standby mode

Software standby
Enables transition to software standby mode

Bit 7—Software Standby (SSBY): Enables transition to software standby mode. (For further information about software standby mode see section 21, Power-Down State.)

When software standby mode is exited by an external interrupt, and a transition is made to normal operation, this bit remains set to 1. To clear this bit, write 0.

Bit 7

SSBY	Description	
0	SLEEP instruction causes transition to sleep mode	(Initial value)
1	SLEEP instruction causes transition to software standby mode	

Bits 6 to 4—Standby Timer Select 2 to 0 (STS2 to STS0): These bits select the length of time the CPU and on-chip supporting modules wait for the internal clock oscillator to settle when software standby mode is exited by an external interrupt.

When using a crystal oscillator, set these bits so that the waiting time will be at least 7 ms at the system clock rate. When operating on an external clock, care is required in the case of the H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version.

For further information about waiting time selection, see section 21.4.3, Selection of Waiting Time for Exit from Software Standby Mode.

Bit 6 STS2	Bit 5 STS1	Bit 4 STS0	Description	
0	0	0	Waiting time = 8,192 states	(Initial value)
0	0	1	Waiting time = 16,384 states	
0	1	0	Waiting time = 32,768 states	
0	1	1	Waiting time = 65,536 states	
1	0	0	Waiting time = 131,072 states	
1	0	1	Waiting time = 262,144 states	
1	1	0	Waiting time = 1,024 states	
1	1	1	Illegal setting	

Bit 3—User Bit Enable (UE): Selects whether to use the UI bit in the condition code register as a user bit or an interrupt mask bit.

Bit 3

UE	Description
0	UI bit in CCR is used as an interrupt mask bit
1	UI bit in CCR is used as a user bit (Initial value)

Bit 2—NMI Edge Select (NMIEG): Selects the valid edge of the NMI input.

Bit 2

NMIEG	Description
0	An interrupt is requested at the falling edge of NMI (Initial value)
1	An interrupt is requested at the rising edge of NMI

Bit 1—Software Standby Output Port Enable (SSOE): Specifies whether the address bus and bus control signals (\overline{CS}_0 to \overline{CS}_7 , \overline{AS} , \overline{RD} , \overline{HWR} , \overline{LWR}) are kept as outputs or fixed high, or placed in the high-impedance state in software standby mode.

Bit 1

SSOE	Description
0	In software standby mode, the address bus and bus control signals are all high-impedance (Initial value)
1	In software standby mode, the address bus retains its output state and bus control signals are fixed high

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized by the rising edge of the \overline{RES} signal. It is not initialized in software standby mode.

Bit 0

RAME	Description
0	On-chip RAM is disabled
1	On-chip RAM is enabled (Initial value)

3.4 Operating Mode Descriptions

3.4.1 Mode 1

Ports 1, 2, and 5 function as address pins A_{19} to A_0 , permitting access to a maximum 1-Mbyte address space. The initial bus mode after a reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits.

3.4.2 Mode 2

Ports 1, 2, and 5 function as address pins A_{19} to A_0 , permitting access to a maximum 1-Mbyte address space. The initial bus mode after a reset is 16 bits, with 16-bit access to all areas. If all areas are designated for 8-bit access in ABWCR, the bus mode switches to 8 bits.

3.4.3 Mode 3

Ports 1, 2, and 5 and part of port A function as address pins A_{23} to A_0 , permitting access to a maximum 16-Mbyte address space. The initial bus mode after a reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits. A_{23} to A_{21} are valid when 0 is written in bits 7 to 5 of the bus release control register (BRCR) (In this mode A_{20} is always used for address output).

3.4.4 Mode 4

Ports 1, 2, and 5 and part of port A function as address pins A_{23} to A_0 , permitting access to a maximum 16-Mbyte address space. The initial bus mode after a reset is 16 bits, with 16-bit access to all areas. If all areas are designated for 8-bit access in ABWCR, the bus mode switches to 8 bits. A_{23} to A_{21} are valid when 0 is written in bits 7 to 5 of BRCR (In this mode A_{20} is always used for address output).

3.4.5 Mode 5

Ports 1, 2, and 5 and part of port A can function as address pins A_{23} to A_0 , permitting access to a maximum 16-Mbyte address space, but following a reset they are input ports. To use ports 1, 2, and 5 as an address bus, the corresponding bits in their data direction registers (P1DDR, P2DDR, and P5DDR) must be set to 1, setting ports 1, 2, and 5 to output mode. For A_{23} to A_{20} output, write 0 in bits 7 to 4 of BRCR. The versions with on-chip flash memory support an on-board programming mode in which the flash memory can be programmed. The initial bus mode after a

reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits.

3.4.6 Mode 6

This mode operates using the on-chip ROM, RAM, and registers. All I/O ports are available. Mode 6 supports a maximum address space of 64 kbytes.

3.4.7 Mode 7

This mode operates using the on-chip ROM, RAM, and registers. All I/O ports are available. Mode 7 supports a 1-Mbyte address space.

The versions with on-chip flash memory support an on-board programming mode in which the flash memory can be programmed.

3.5 Pin Functions in Each Operating Mode

The pin functions of ports 1 to 5 and port A vary depending on the operating mode. Table 3.3 indicates their functions in each operating mode.

Table 3.3 Pin Functions in Each Mode

Port	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7
Port 1	A ₇ to A ₀	A ₇ to A ₀	A ₇ to A ₀	A ₇ to A ₀	P ₁₇ to P ₁₀ ^{*2}	P ₁₇ to P ₁₀	P ₁₇ to P ₁₀
Port 2	A ₁₅ to A ₈	A ₁₅ to A ₈	A ₁₅ to A ₈	A ₁₅ to A ₈	P ₂₇ to P ₂₀ ^{*2}	P ₂₇ to P ₂₀	P ₂₇ to P ₂₀
Port 3	D ₁₅ to D ₈	D ₁₅ to D ₈	D ₁₅ to D ₈	D ₁₅ to D ₈	D ₁₅ to D ₈	P ₃₇ to P ₃₀	P ₃₇ to P ₃₀
Port 4	P ₄₇ to P ₄₀ ^{*1}	D ₇ to D ₀ ^{*1}	P ₄₇ to P ₄₀ ^{*1}	D ₇ to D ₀ ^{*1}	P ₄₇ to P ₄₀ ^{*1}	P ₄₇ to P ₄₀	P ₄₇ to P ₄₀
Port 5	A ₁₉ to A ₁₆	A ₁₉ to A ₁₆	A ₁₉ to A ₁₆	A ₁₉ to A ₁₆	P ₅₃ to P ₅₀ ^{*2}	P ₅₃ to P ₅₀	P ₅₃ to P ₅₀
Port A	PA ₇ to PA ₄	PA ₇ to PA ₄	PA ₆ to PA ₄ , A ₂₀ ^{*3}	PA ₆ to PA ₄ , A ₂₀ ^{*3}	PA ₇ to PA ₄ ^{*4}	PA ₇ to PA ₄	PA ₇ to PA ₄

- Notes:
- Initial state. The bus mode can be switched by settings in ABWCR. These pins function as P₄₇ to P₄₀ in 8-bit bus mode, and as D₇ to D₀ in 16-bit bus mode.
 - Initial state. These pins become address output pins when the corresponding bits in the data direction registers (P1DDR, P2DDR, P5DDR) are set to 1.
 - Initial state. A₂₀ is always an address output pin. PA₆ to PA₄ are switched over to A₂₃ to A₂₁ output by writing 0 in bits 7 to 5 of BRCR.
 - Initial state. PA₇ to PA₄ are switched over to A₂₃ to A₂₀ output by writing 0 in bits 7 to 4 of BRCR.

3.6 Memory Map in Each Operating Mode

Figures 3.1 to 3.4 show memory maps of the H8/3062 Group. In the expanded modes, the address space is divided into eight areas.

The initial bus mode differs between modes 1 and 2, and also between modes 3 and 4.

The address locations of the on-chip RAM and on-chip registers differ between the 64-kbyte mode (mode 6), the 1-Mbyte modes (modes 1, 2, and 7), and the 16-Mbyte modes (modes 3, 4, and 5). The address range specifiable by the CPU in the 8- and 16-bit absolute addressing modes (@aa:8 and @aa:16) also differs.

3.6.1 Comparison of H8/3062 Group Memory Maps

In the H8/3062 Group, the address maps vary according to the size of the on-chip ROM and RAM. The internal I/O register space is the same in all models, and the H8/3062F-ZTAT B-mask version and H8/3062 have the same address map. The H8/3064F-ZTAT B-mask version and H8/3064 masked ROM B-mask version have the same address map. Table 3.4 shows the various address maps in mode 5.

Table 3.4 Address Maps in Mode 5

		H8/3062 Masked ROM Version, H8/3062 Masked ROM B-Mask Version, H8/3062F-ZTAT R-Mask Version, H8/3062F-ZTAT B-Mask Version	H8/3061 Masked ROM Version, H8/3061 Masked ROM B-Mask Version	H8/3060 Masked ROM Version, H8/3060 Masked ROM B-Mask Version	H8/3064 Masked ROM B-Mask Version, H8/3064F-ZTAT B-Mask Version
On-chip ROM	Size	128 kbytes	96 kbytes	64 kbytes	256 kbytes
	Address area	H'000000 to H'01FFFF	H'000000 to H'017FFF	H'000000 to H'00FFFF	H'000000 to H'03FFFF
On-chip RAM	Size	4 kbytes	4 kbytes	2 kbytes	8 kbytes
	Address area	H'FFEF20 to H'FFFF1F	H'FFEF20 to H'FFFF1F	H'FFF720 to H'FFFF1F	H'FFDF20 to H'FFFF1F

3.6.2 Reserved Areas

The H8/3062 Group memory map includes reserved areas to which access (reading or writing) is prohibited. Normal operation cannot be guaranteed if the following reserved areas are accessed.

Reserved Area in Internal I/O Register Space: The H8/3062 Group internal I/O register space includes a reserved area to which access is prohibited. For details see appendix B, Internal I/O Registers.

Other Reserved Areas: In mode 5 in the H8/3061 masked ROM version, H8/3061 masked ROM B-mask version, H8/3060 masked ROM version, and H8/3060 masked ROM B-mask version there is a reserved area in area 0, as shown in figures 3.2 and 3.3.

In modes 1 to 5 in the H8/3060 masked ROM version and H8/3060 masked ROM B-mask version there is a reserved area in area 7, as shown in figure 3.3.

Note: * External addresses can be accessed by disabling on-chip RAM.

**Figure 3.1 Memory Map of H8/3062F-ZTAT R-Mask Version,

Section 4 Exception Handling

4.1 Overview

4.1.1 Exception Handling Types and Priority

As table 4.1 indicates, exception handling may be caused by a reset, interrupt, or trap instruction. Exception handling is prioritized as shown in table 4.1. If two or more exceptions occur simultaneously, they are accepted and processed in priority order. Trap instruction exceptions are accepted at all times in the program execution state.

Table 4.1 Exception Types and Priority

Priority	Exception Type	Start of Exception Handling
High	Reset	Starts immediately after a low-to-high transition at the RES pin
↑	Interrupt	Interrupt requests are handled when execution of the current instruction or handling of the current exception is completed
	Trap instruction (TRAPA)	Started by execution of a trap instruction (TRAPA)
Low		

4.1.2 Exception Handling Operation

Exceptions originate from various sources. Trap instructions and interrupts are handled as follows.

1. The program counter (PC) and condition code register (CCR) are pushed onto the stack.
2. The CCR interrupt mask bit is set to 1.
3. A vector address corresponding to the exception source is generated, and program execution starts from that address.

Note: For a reset exception, steps 2 and 3 above are carried out.

4.1.3 Exception Vector Table

The exception sources are classified as shown in figure 4.1. Different vectors are assigned to different exception sources. Table 4.2 lists the exception sources and their vector addresses.

Figure 4.1 Exception Sources

Table 4.2 Exception Vector Table

Exception Source	Vector Number	Vector Address*1	
		Advanced Mode	Normal Mode
Reset	0	H'0000 to H'0003	H'0000 to H'0001
Reserved for system use	1	H'0004 to H'0007	H'0002 to H'0003
	2	H'0008 to H'000B	H'0004 to H'0005
	3	H'000C to H'000F	H'0006 to H'0007
	4	H'0010 to H'0013	H'0008 to H'0009
	5	H'0014 to H'0017	H'000A to H'000B
	6	H'0018 to H'001B	H'000C to H'000D
	External interrupt (NMI)	7	H'001C to H'001F
Trap instruction (4 sources)	8	H'0020 to H'0023	H'0010 to H'0011
	9	H'0024 to H'0027	H'0012 to H'0013
	10	H'0028 to H'002B	H'0014 to H'0015
	11	H'002C to H'002F	H'0016 to H'0017
External interrupt IRQ ₀	12	H'0030 to H'0033	H'0018 to H'0019
External interrupt IRQ ₁	13	H'0034 to H'0037	H'001A to H'001B
External interrupt IRQ ₂	14	H'0038 to H'003B	H'001C to H'001D
External interrupt IRQ ₃	15	H'003C to H'003F	H'001E to H'001F
External interrupt IRQ ₄	16	H'0040 to H'0043	H'0020 to H'0021
External interrupt IRQ ₅	17	H'0044 to H'0047	H'0022 to H'0023
Reserved for system use	18	H'0048 to H'004B	H'0024 to H'0025
	19	H'004C to H'004F	H'0026 to H'0027
Internal interrupts*2	20	H'0050 to H'0053	H'0028 to H'0029
	to	to	to
	63	H'00FC to H'00FF	H'007E to H'007F

Notes: 1. Lower 16 bits of the address

2. For the internal interrupt vectors, see section 5.3.3, Interrupt Exception Handling Vector Table.

4.2 Reset

4.2.1 Overview

A reset is the highest-priority exception. When the $\overline{\text{RES}}$ pin goes low, all processing halts and the chip enters the reset state. A reset initializes the internal state of the CPU and the registers of the on-chip supporting modules. Reset exception handling begins when the $\overline{\text{RES}}$ pin changes from low to high.

The chip can also be reset by overflow of the watchdog timer. For details see section 11, Watchdog Timer.

4.2.2 Reset Sequence

The chip enters the reset state when the $\overline{\text{RES}}$ pin goes low.

To ensure that the chip is reset, hold the $\overline{\text{RES}}$ pin low for at least 20 ms at power-up. To reset the chip during operation, hold the $\overline{\text{RES}}$ pin low for at least 10 system clock (ϕ) cycles. In the versions with on-chip flash memory, the $\overline{\text{RES}}$ pin must be held low for at least 20 system clock cycles. See appendix D.2, Pin States at Reset, for the states of the pins in the reset state.

When the $\overline{\text{RES}}$ pin goes high after being held low for the necessary time, the chip starts reset exception handling as follows.

- The internal state of the CPU and the registers of the on-chip supporting modules are initialized, and the I bit is set to 1 in CCR.
- The contents of the reset vector address (H'0000 to H'0003 in advanced mode, H'0000 to H'0001 in normal mode) are read, and program execution starts from the address indicated in the vector address.

Figure 4.2 shows the reset sequence in modes 1 and 3. Figure 4.3 shows the reset sequence in modes 2 and 4. Figure 4.4 shows the reset sequence in mode 6.

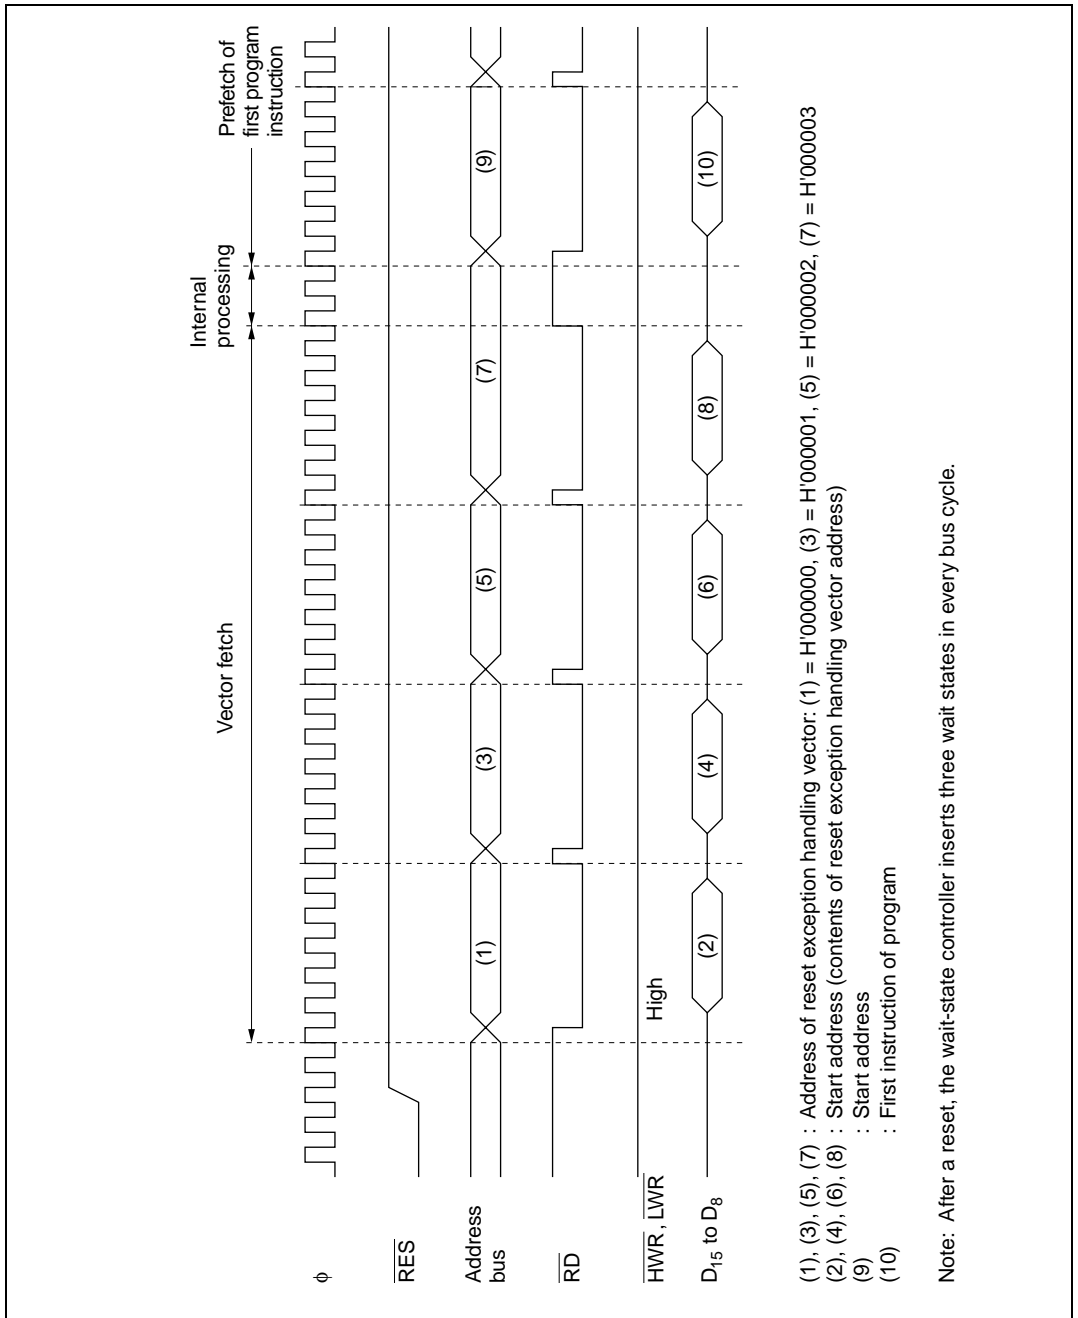

Figure 4.2 Reset Sequence (Modes 1 and 3)

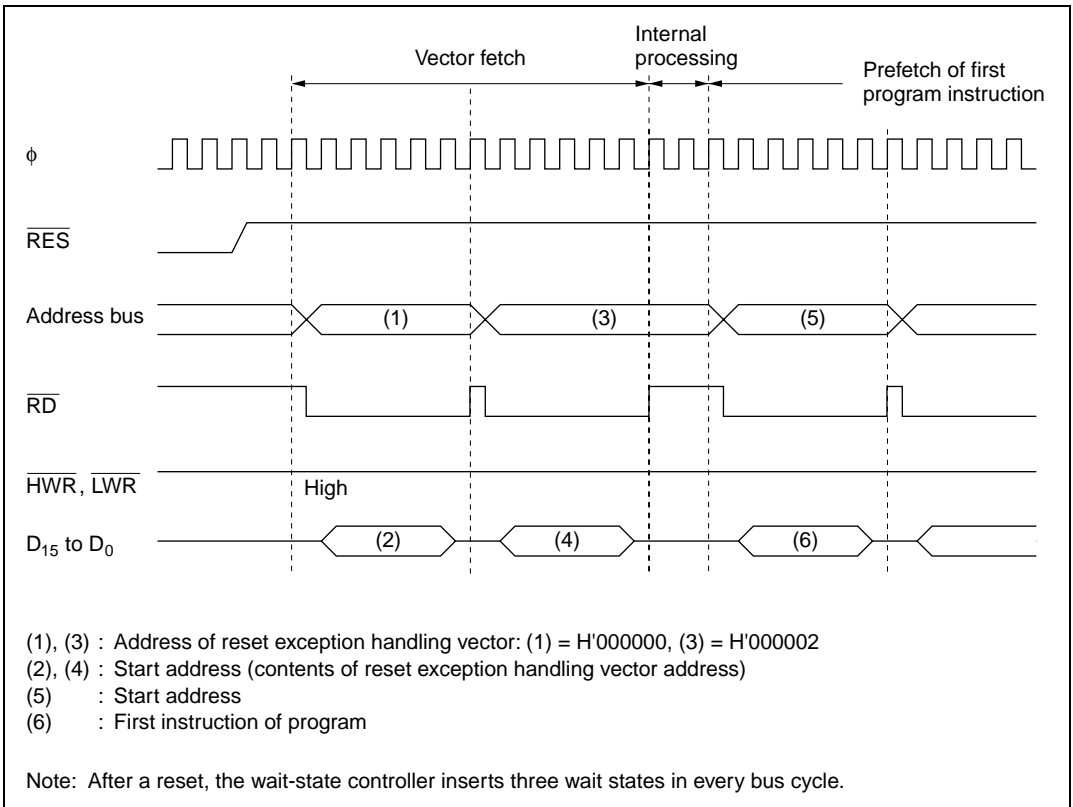

Figure 4.3 Reset Sequence (Modes 2 and 4)

Figure 4.4 Reset Sequence (Mode 6)

4.2.3 Interrupts after Reset

If an interrupt is accepted after a reset but before the stack pointer (SP) is initialized, PC and CCR will not be saved correctly, leading to a program crash. To prevent this, all interrupt requests, including NMI, are disabled immediately after a reset exception handling. The first instruction of the program is always executed immediately after the reset state ends. This instruction should initialize the stack pointer (example: `MOV.L #xx:32, SP`).

4.3 Interrupts

Interrupt exception handling can be requested by seven external sources (NMI, IRQ₀ to IRQ₅), and 27 internal sources in the on-chip supporting modules. Figure 4.5 classifies the interrupt sources and indicates the number of interrupts of each type.

The on-chip supporting modules that can request interrupts are the watchdog timer (WDT), 16-bit timer, 8-bit timer, serial communication interface (SCI), and A/D converter. Each interrupt source has a separate vector address.

NMI is the highest-priority interrupt and is always accepted*. Interrupts are controlled by the interrupt controller. The interrupt controller can assign interrupts other than NMI to two priority levels, and arbitrate between simultaneous interrupts. Interrupt priorities are assigned in interrupt priority registers A and B (IPRA and IPRB) in the interrupt controller.

For details on interrupts see section 5, Interrupt Controller.

Note: * In the versions with on-chip flash memory, NMI input is sometimes disabled. For details see section 17.6.4, NMI Input Disabling Conditions.

Figure 4.5 Interrupt Sources and Number of Interrupts

4.4 Trap Instruction

Trap instruction exception handling starts when a TRAPA instruction is executed. If the UE bit is set to 1 in the system control register (SYSCR), the exception handling sequence sets the I bit to 1 in CCR. If the UE bit is 0, the I and UI bits are both set to 1 in CCR. The TRAPA instruction fetches a start address from a vector table entry corresponding to a vector number from 0 to 3, which is specified in the instruction code.

4.5 Stack Status after Exception Handling

Figure 4.6 shows the stack after completion of trap instruction exception handling and interrupt exception handling.

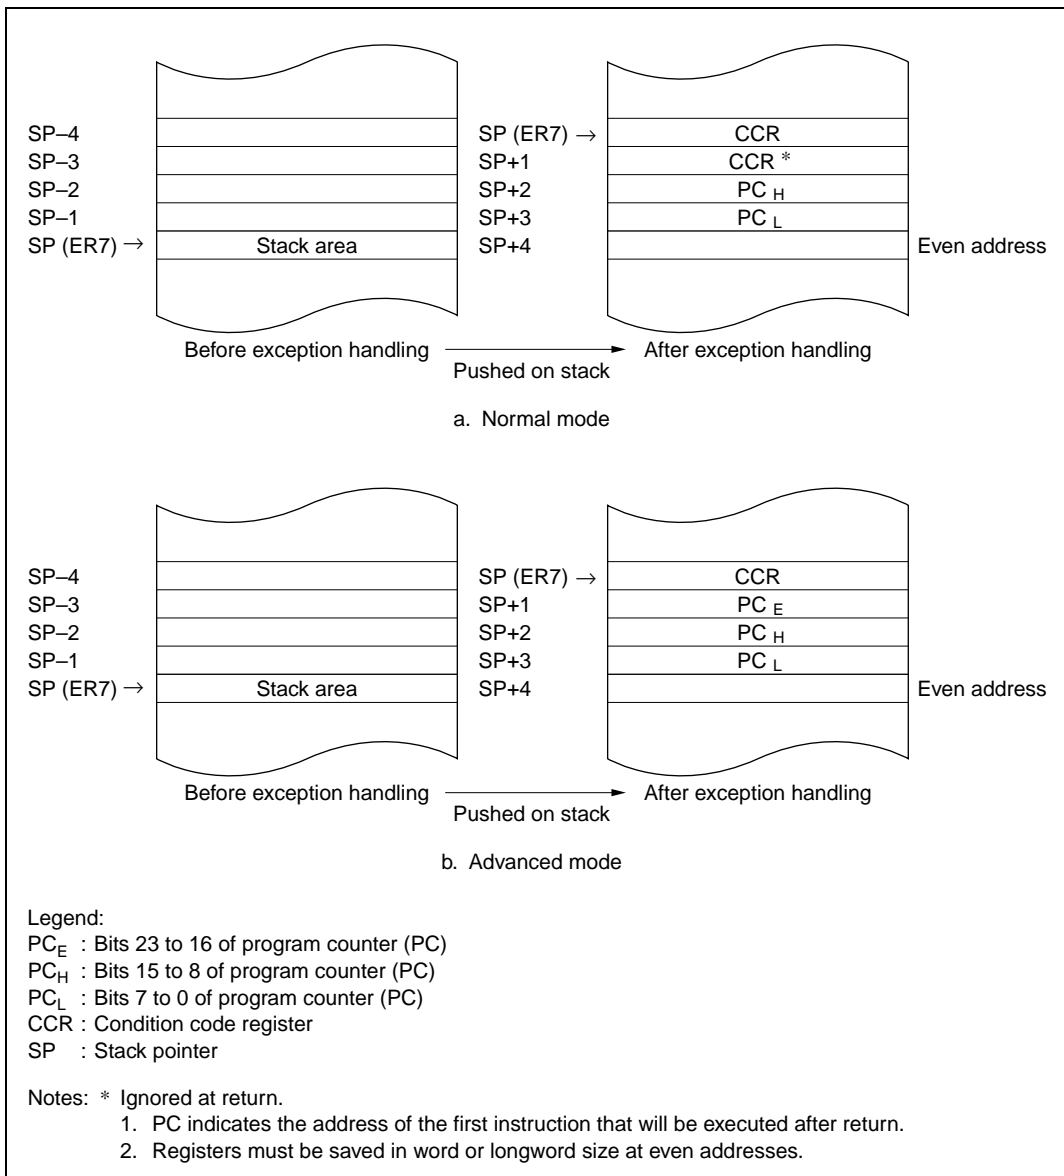

Figure 4.6 Stack after Completion of Exception Handling

4.6 Notes on Stack Usage

When accessing word data or longword data, the H8/3062 Group regards the lowest address bit as 0. The stack should always be accessed by word access or longword access, and the value of the stack pointer (SP:ER7) should always be kept even.

Use the following instructions to save registers:

PUSH.W Rn (or MOV.W Rn, @-SP)
PUSH.L ERn (or MOV.L ERn, @-SP)

Use the following instructions to restore registers:

POP.W Rn (or MOV.W @SP+, Rn)
POP.L ERn (or MOV.L @SP+, ERn)

Setting SP to an odd value may lead to a malfunction. Figure 4.7 shows an example of what happens when the SP value is odd.

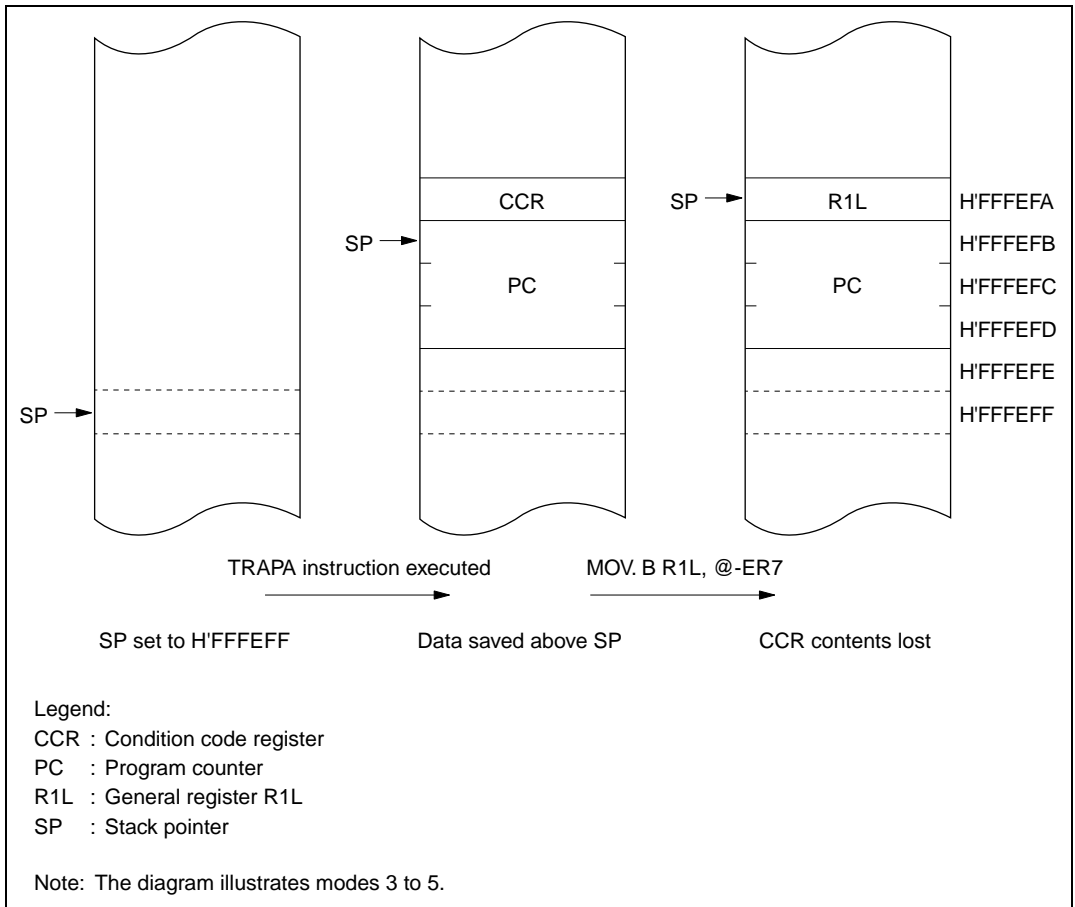

Figure 4.7 Operation when SP Value is Odd

Section 5 Interrupt Controller

5.1 Overview

5.1.1 Features

The interrupt controller has the following features:

- Interrupt priority registers (IPRs) for setting interrupt priorities
Interrupts other than NMI can be assigned to two priority levels on a module-by-module basis in interrupt priority registers A and B (IPRA and IPRB).
- Three-level enabling/disabling by the I and UI bits in the CPU's condition code register (CCR) and the UE bit in the system control register (SYSCR)
- Seven external interrupt pins
NMI has the highest priority and is always accepted*; either the rising or falling edge can be selected. For each of IRQ₀ to IRQ₅, sensing of the falling edge or level sensing can be selected independently.

Note: * In the versions with on-chip flash memory, NMI input is sometimes disabled. For details see section 17.6.4, NMI Input Disabling Conditions.

5.1.2 Block Diagram

Figure 5.1 shows a block diagram of the interrupt controller.

Figure 5.1 Interrupt Controller Block Diagram

5.1.3 Pin Configuration

Table 5.1 lists the interrupt pins.

Table 5.1 Interrupt Pins

Name	Abbreviation	I/O	Function
Nonmaskable interrupt	NMI	Input	Nonmaskable interrupt*, rising edge or falling edge selectable
External interrupt request 5 to 0	\overline{IRQ}_5 to \overline{IRQ}_0	Input	Maskable interrupts, falling edge or level sensing selectable

Note: * In the versions with on-chip flash memory, NMI input is sometimes disabled. For details see 17.6.4, NMI Input Disable Conditions.

5.1.4 Register Configuration

Table 5.2 lists the registers of the interrupt controller.

Table 5.2 Interrupt Controller Registers

Address* ¹	Name	Abbreviation	R/W	Initial Value
H'EE012	System control register	SYSCR	R/W	H'09
H'EE014	IRQ sense control register	ISCR	R/W	H'00
H'EE015	IRQ enable register	IER	R/W	H'00
H'EE016	IRQ status register	ISR	R/(W)* ²	H'00
H'EE018	Interrupt priority register A	IPRA	R/W	H'00
H'EE019	Interrupt priority register B	IPRB	R/W	H'00

Notes: 1. Lower 20 bits of the address in advanced mode
2. Only 0 can be written, to clear flags.

5.2 Register Descriptions

5.2.1 System Control Register (SYSCR)

SYSCR is an 8-bit readable/writable register that controls software standby mode, selects the action of the UI bit in CCR, selects the NMI edge, and enables or disables the on-chip RAM.

Only bits 3 and 2 are described here. For the other bits, see section 3.3, System Control Register (SYSCR).

SYSCR is initialized to H'09 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 3—User Bit Enable (UE): Selects whether to use the UI bit in CCR as a user bit or an interrupt mask bit.

Bit 3

UE	Description
0	UI bit in CCR is used as interrupt mask bit
1	UI bit in CCR is used as user bit (Initial value)

Bit 2—NMI Edge Select (NMIEG): Selects the NMI input edge.

Bit 2

NMIEG	Description
0	Interrupt is requested at falling edge of NMI input (Initial value)
1	Interrupt is requested at rising edge of NMI input

5.2.2 Interrupt Priority Registers A and B (IPRA, IPRB)

IPRA and IPRB are 8-bit readable/writable registers that control interrupt priority.

Interrupt Priority Register A (IPRA): IPRA is an 8-bit readable/writable register in which interrupt priority levels can be set.

IPRA is initialized to H'00 by a reset and in hardware standby mode.

Bit 7—Priority Level A7 (IPRA7): Selects the priority level of IRQ₀ interrupt requests.

Bit 7 IPRA7	Description	
0	IRQ ₀ interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ ₀ interrupt requests have priority level 1 (high priority)	

Bit 6—Priority Level A6 (IPRA6): Selects the priority level of IRQ₁ interrupt requests.

Bit 6 IPRA6	Description	
0	IRQ ₁ interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ ₁ interrupt requests have priority level 1 (high priority)	

Bit 5—Priority Level A5 (IPRA5): Selects the priority level of IRQ₂ and IRQ₃ interrupt requests.

Bit 5 IPRA5	Description	
0	IRQ ₂ and IRQ ₃ interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ ₂ and IRQ ₃ interrupt requests have priority level 1 (high priority)	

Bit 4—Priority Level A4 (IPRA4): Selects the priority level of IRQ₄ and IRQ₅ interrupt requests.

Bit 4 IPRA4	Description	
0	IRQ ₄ and IRQ ₅ interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ ₄ and IRQ ₅ interrupt requests have priority level 1 (high priority)	

Bit 3—Priority Level A3 (IPRA3): Selects the priority level of WDT, and A/D converter interrupt requests.

Bit 3 IPRA3	Description	
0	WDT, and A/D converter interrupt requests have priority level 0 (low priority)	(Initial value)
1	WDT, and A/D converter interrupt requests have priority level 1 (high priority)	

Bit 2—Priority Level A2 (IPRA2): Selects the priority level of 16-bit timer channel 0 interrupt requests.

Bit 2 IPRA2	Description
0	16-bit timer channel 0 interrupt requests have priority level 0 (low priority) (Initial value)
1	16-bit timer channel 0 interrupt requests have priority level 1 (high priority)

Bit 1—Priority Level A1 (IPRA1): Selects the priority level of 16-bit timer channel 1 interrupt requests.

Bit 1 IPRA1	Description
0	16-bit timer channel 1 interrupt requests have priority level 0 (low priority) (Initial value)
1	16-bit timer channel 1 interrupt requests have priority level 1 (high priority)

Bit 0—Priority Level A0 (IPRA0): Selects the priority level of 16-bit timer channel 2 interrupt requests.

Bit 0 IPRA0	Description
0	16-bit timer channel 2 interrupt requests have priority level 0 (low priority) (Initial value)
1	16-bit timer channel 2 interrupt requests have priority level 1 (high priority)

Interrupt Priority Register B (IPRB): IPRB is an 8-bit readable/writable register in which interrupt priority levels can be set.

Bit	7	6	5	4	3	2	1	0
	IPRB7	IPRB6	—	—	IPRB3	IPRB2	—	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bit

Priority level B2
Selects the priority level of SCI channel 1 interrupt requests

Priority level B3
Selects the priority level of SCI channel 0 interrupt requests

Reserved bit

Priority level B6
Selects the priority level of 8-bit timer channel 2, 3 interrupt requests

Priority level B7
Selects the priority level of 8-bit timer channel 0, 1 interrupt requests

IPRB is initialized to H'00 by a reset and in hardware standby mode.

Bit 7—Priority Level B7 (IPRB7): Selects the priority level of 8-bit timer channel 0, 1 interrupt requests.

Bit 7

IPRB7 Description

0	8-bit timer channel 0 and 1 interrupt requests have priority level 0 (low priority) (Initial value)
1	8-bit timer channel 0 and 1 interrupt requests have priority level 1 (high priority)

Bit 6—Priority Level B6 (IPRB6): Selects the priority level of 8-bit timer channel 2, 3 interrupt requests.

Bit 6 IPRB6	Description
0	8-bit timer channel 2 and 3 interrupt requests have priority level 0 (low priority) (Initial value)
1	8-bit timer channel 2 and 3 interrupt requests have priority level 1 (high priority)

Bits 5 and 4—Reserved: This bit can be written and read, but it does not affect interrupt priority.

Bit 3—Priority Level B3 (IPRB3): Selects the priority level of SCI channel 0 interrupt requests.

Bit 3 IPRB3	Description
0	SCI0 channel 0 interrupt requests have priority level 0 (low priority) (Initial value)
1	SCI0 channel 0 interrupt requests have priority level 1 (high priority)

Bit 2—Priority Level B2 (IPRB2): Selects the priority level of SCI channel 1 interrupt requests.

Bit 2 IPRB2	Description
0	SCI1 channel 1 interrupt requests have priority level 0 (low priority) (Initial value)
1	SCI1 channel 1 interrupt requests have priority level 1 (high priority)

Bits 1 and 0—Reserved: This bit can be written and read, but it does not affect interrupt priority.

5.2.3 IRQ Status Register (ISR)

ISR is an 8-bit readable/writable register that indicates the status of IRQ₀ to IRQ₅ interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5F	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value	0	0	0	0	0	0	0	0
Read/Write	—	—	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Reserved bits
IRQ₅ to IRQ₀ flags
 These bits indicate IRQ₅ to IRQ₀ flag interrupt request status

Note: * Only 0 can be written, to clear flags.

ISR is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 and 6—Reserved: These bits can not be modified and are always read as 0.

Bits 5 to 0—IRQ₅ to IRQ₀ Flags (IRQ5F to IRQ0F): These bits indicate the status of IRQ₅ to IRQ₀ interrupt requests.

Bits 5 to 0

IRQ5F to IRQ0F Description

0	[Clearing conditions] (Initial value)
	<ul style="list-style-type: none"> • 0 is written in IRQnF after reading the IRQnF flag when IRQnF = 1. • IRQnSC = 0, $\overline{\text{IRQn}}$ input is high, and interrupt exception handling is carried out. • IRQnSC = 1 and IRQn interrupt exception handling is carried out.
1	[Setting conditions]
	<ul style="list-style-type: none"> • IRQnSC = 0 and $\overline{\text{IRQn}}$ input is low. • IRQnSC = 1 and $\overline{\text{IRQn}}$ input changes from high to low.

Note: n = 5 to 0

5.2.4 IRQ Enable Register (IER)

IER is an 8-bit readable/writable register that enables or disables IRQ₅ to IRQ₀ interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5E	IRQ4E	IRQ3E	IRQ2E	IRQ1E	IRQ0E
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits
IRQ₅ to IRQ₀ enable
 These bits enable or disable IRQ₅ to IRQ₀ interrupts

IER is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 and 6—Reserved: These bits can be written and read, but they do not enable or disable interrupts.

Bits 5 to 0—IRQ₅ to IRQ₀ Enable (IRQ5E to IRQ0E): These bits enable or disable IRQ₅ to IRQ₀ interrupts.

Bits 5 to 0

IRQ5E to IRQ0E Description

	Description	
0	IRQ ₅ to IRQ ₀ interrupts are disabled	(Initial value)
1	IRQ ₅ to IRQ ₀ interrupts are enabled	

5.2.5 IRQ Sense Control Register (ISCR)

ISCR is an 8-bit readable/writable register that selects level sensing or falling-edge sensing of the inputs at pins $\overline{\text{IRQ}}_5$ to $\overline{\text{IRQ}}_0$.

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5SC	IRQ4SC	IRQ3SC	IRQ2SC	IRQ1SC	IRQ0SC
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

IRQ₅ to IRQ₀ sense control

These bits select level sensing or falling-edge sensing for IRQ₅ to IRQ₀ interrupts

ISCR is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 and 6—Reserved: These bits can be written and read, but they do not select level or falling-edge sensing.

Bits 5 to 0—IRQ₅ to IRQ₀ Sense Control (IRQ5SC to IRQ0SC): These bits select whether interrupts IRQ₅ to IRQ₀ are requested by level sensing of pins $\overline{\text{IRQ}}_5$ to $\overline{\text{IRQ}}_0$, or by falling-edge sensing.

Bits 5 to 0

IRQ5SC to IRQ0SC Description

0	Interrupts are requested when $\overline{\text{IRQ}}_5$ to $\overline{\text{IRQ}}_0$ inputs are low	(Initial value)
1	Interrupts are requested by falling-edge input at $\overline{\text{IRQ}}_5$ to $\overline{\text{IRQ}}_0$	

5.3 Interrupt Sources

The interrupt sources include external interrupts (NMI, IRQ₀ to IRQ₅) and 27 internal interrupts.

5.3.1 External Interrupts

There are seven external interrupts: NMI, and IRQ₀ to IRQ₅. Of these, NMI, IRQ₀, IRQ₁, and IRQ₂ can be used to exit software standby mode.

NMI: NMI is the highest-priority interrupt and is always accepted, regardless of the states of the I and UI bits in CCR*. The NMIEG bit in SYSCR selects whether an interrupt is requested by the rising or falling edge of the input at the NMI pin. NMI interrupt exception handling has vector number 7.

Note: * In the versions with on-chip flash memory, NMI input is sometimes disabled. For details see section 17.6.4, NMI Input Disable Conditions.

IRQ₀ to IRQ₅ Interrupts: These interrupts are requested by input signals at pins $\overline{\text{IRQ}}_0$ to $\overline{\text{IRQ}}_5$. The IRQ₀ to IRQ₅ interrupts have the following features.

- ISCR settings can select whether an interrupt is requested by the low level of the input at pins $\overline{\text{IRQ}}_0$ to $\overline{\text{IRQ}}_5$, or by the falling edge.
- IER settings can enable or disable the IRQ₀ to IRQ₅ interrupts. Interrupt priority levels can be assigned by four bits in IPRA (IPRA7 to IPRA4).
- The status of IRQ₀ to IRQ₅ interrupt requests is indicated in ISR. The ISR flags can be cleared to 0 by software.

Figure 5.2 shows a block diagram of interrupts IRQ₀ to IRQ₅.

Figure 5.2 Block Diagram of Interrupts IRQ₀ to IRQ₅

Figure 5.3 shows the timing of the setting of the interrupt flags (IRQnF).

Figure 5.3 Timing of Setting of IRQnF

Interrupts IRQ₀ to IRQ₅ have vector numbers 12 to 17. These interrupts are detected regardless of whether the corresponding pin is set for input or output. When using a pin for external interrupt input, clear its DDR bit to 0 and do not use the pin for chip select output, SCI input/output, or A/D external trigger input.

5.3.2 Internal Interrupts

27 internal interrupts are requested from the on-chip supporting modules.

- Each on-chip supporting module has status flags for indicating interrupt status, and enable bits for enabling or disabling interrupts.
- Interrupt priority levels can be assigned in IPRA and IPRB.

5.3.3 Interrupt Exception Handling Vector Table

Table 5.3 lists the interrupt exception handling sources, their vector addresses, and their default priority order. In the default priority order, smaller vector numbers have higher priority. The priority of interrupts other than NMI can be changed in IPRA and IPRB. The priority order after a reset is the default order shown in table 5.3.

Table 5.3 Interrupt Sources, Vector Addresses, and Priority

Interrupt Source	Origin	Vector Number	Vector Address*		IPR	Priority	
			Advanced Mode	Normal Mode			
NMI	External pins	7	H'001C to H'001F	H'000E to H'000F	—	High ↑	
IRQ ₀		12	H'0030 to H'0033	H'0018 to H'0019	IPRA7		
IRQ ₁		13	H'0034 to H'0037	H'001A to H'001B	IPRA6		
IRQ ₂		14	H'0038 to H'003B	H'001C to H'001D	IPRA5		
IRQ ₃		15	H'003C to H'003F	H'001E to H'001F

5.4 Interrupt Operation

5.4.1 Interrupt Handling Process

The H8/3062 Group handles interrupts differently depending on the setting of the UE bit. When UE = 1, interrupts are controlled by the I bit. When UE = 0, interrupts are controlled by the I and UI bits. Table 5.4 indicates how interrupts are handled for all setting combinations of the UE, I, and UI bits.

NMI interrupts are always accepted except in the reset and hardware standby states*. IRQ interrupts and interrupts from the on-chip supporting modules have their own enable bits. Interrupt requests are ignored when the enable bits are cleared to 0.

Note: * In the versions with on-chip flash memory, NMI input is sometimes disabled. For details see section 17.6.4, NMI Input Disable Conditions.

Table 5.4 UE, I, and UI Bit Settings and Interrupt Handling

SYSCR	CCR		Description
	I	UI	
1	0	—	All interrupts are accepted. Interrupts with priority level 1 have higher priority.
	1	—	No interrupts are accepted except NMI.
0	0	—	All interrupts are accepted. Interrupts with priority level 1 have higher priority.
	1	0	NMI and interrupts with priority level 1 are accepted.
		1	No interrupts are accepted except NMI.

UE = 1: Interrupts IRQ₀ to IRQ₅ and interrupts from the on-chip supporting modules can all be masked by the I bit in the CPU's CCR. Interrupts are masked when the I bit is set to 1, and unmasked when the I bit is cleared to 0. Interrupts with priority level 1 have higher priority. Figure 5.4 is a flowchart showing how interrupts are accepted when UE = 1.

Figure 5.4 Process Up to Interrupt Acceptance when UE = 1

- If an interrupt condition occurs and the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.
- When the interrupt controller receives one or more interrupt requests, it selects the highest-priority request, following the IPR interrupt priority settings, and holds other requests pending. If two or more interrupts with the same IPR setting are requested simultaneously, the interrupt controller follows the priority order shown in table 5.3.
- The interrupt controller checks the I bit. If the I bit is cleared to 0, the selected interrupt request is accepted. If the I bit is set to 1, only NMI is accepted; other interrupt requests are held pending.
- When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.
- In interrupt exception handling, PC and CCR are saved to the stack area. The PC value that is saved indicates the address of the first instruction that will be executed after the return from the interrupt service routine.
- Next the I bit is set to 1 in CCR, masking all interrupts except NMI.
- The vector address of the accepted interrupt is generated, and the interrupt service routine starts executing from the address indicated by the contents of the vector address.

UE = 0: The I and UI bits in the CPU's CCR and the IPR bits enable three-level masking of IRQ₀ to IRQ₅ interrupts and interrupts from the on-chip supporting modules.

- Interrupt requests with priority level 0 are masked when the I bit is set to 1, and are unmasked when the I bit is cleared to 0.
- Interrupt requests with priority level 1 are masked when the I and UI bits are both set to 1, and are unmasked when either the I bit or the UI bit is cleared to 0.

For example, if the interrupt enable bits of all interrupt requests are set to 1, IPRA is set to H'20, and IPRB is set to H'00 (giving IRQ₂ and IRQ₃ interrupt requests priority over other interrupts), interrupts are masked as follows:

- a. If I = 0, all interrupts are unmasked (priority order: NMI > IRQ₂ > IRQ₃ > IRQ₀ ...).
- b. If I = 1 and UI = 0, only NMI, IRQ₂, and IRQ₃ are unmasked.
- c. If I = 1 and UI = 1, all interrupts are masked except NMI.

Figure 5.5 shows the transitions among the above states.

Figure 5.5 Interrupt Masking State Transitions (Example)

Figure 5.6 is a flowchart showing how interrupts are accepted when UE = 0.

- If an interrupt condition occurs and the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.
- When the interrupt controller receives one or more interrupt requests, it selects the highest-priority request, following the IPR interrupt priority settings, and holds other requests pending. If two or more interrupts with the same IPR setting are requested simultaneously, the interrupt controller follows the priority order shown in table 5.3.
- The interrupt controller checks the I bit. If the I bit is cleared to 0, the selected interrupt request is accepted regardless of its IPR setting, and regardless of the UI bit. If the I bit is set to 1 and the UI bit is cleared to 0, only interrupts with priority level 1 are accepted; interrupt requests with priority level 0 are held pending. If the I bit and UI bit are both set to 1, all other interrupt requests are held pending.
- When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.
- In interrupt exception handling, PC and CCR are saved to the stack area. The PC value that is saved indicates the address of the first instruction that will be executed after the return from the interrupt service routine.
- The I and UI bits are set to 1 in CCR, masking all interrupts except NMI.
- The vector address of the accepted interrupt is generated, and the interrupt service routine starts executing from the address indicated by the contents of the vector address.

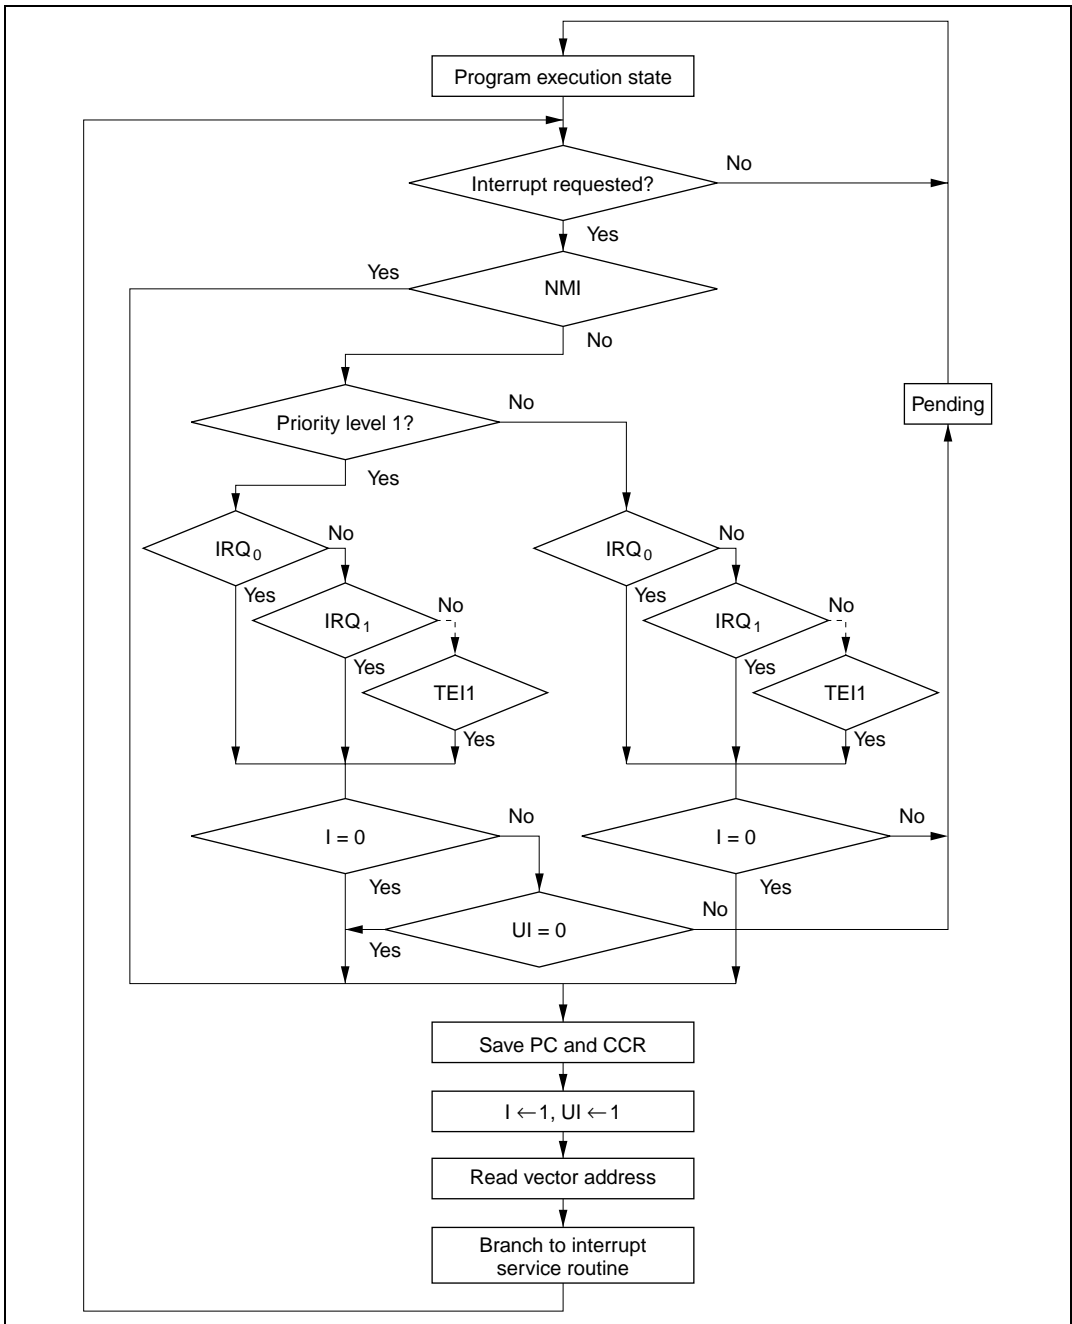

Figure 5.6 Process Up to Interrupt Acceptance when UE = 0

5.4.2 Interrupt Exception Handling Sequence

Figure 5.7 shows the interrupt exception handling sequence in mode 2 when the program code and stack are in an external memory area accessed in two states via a 16-bit bus.

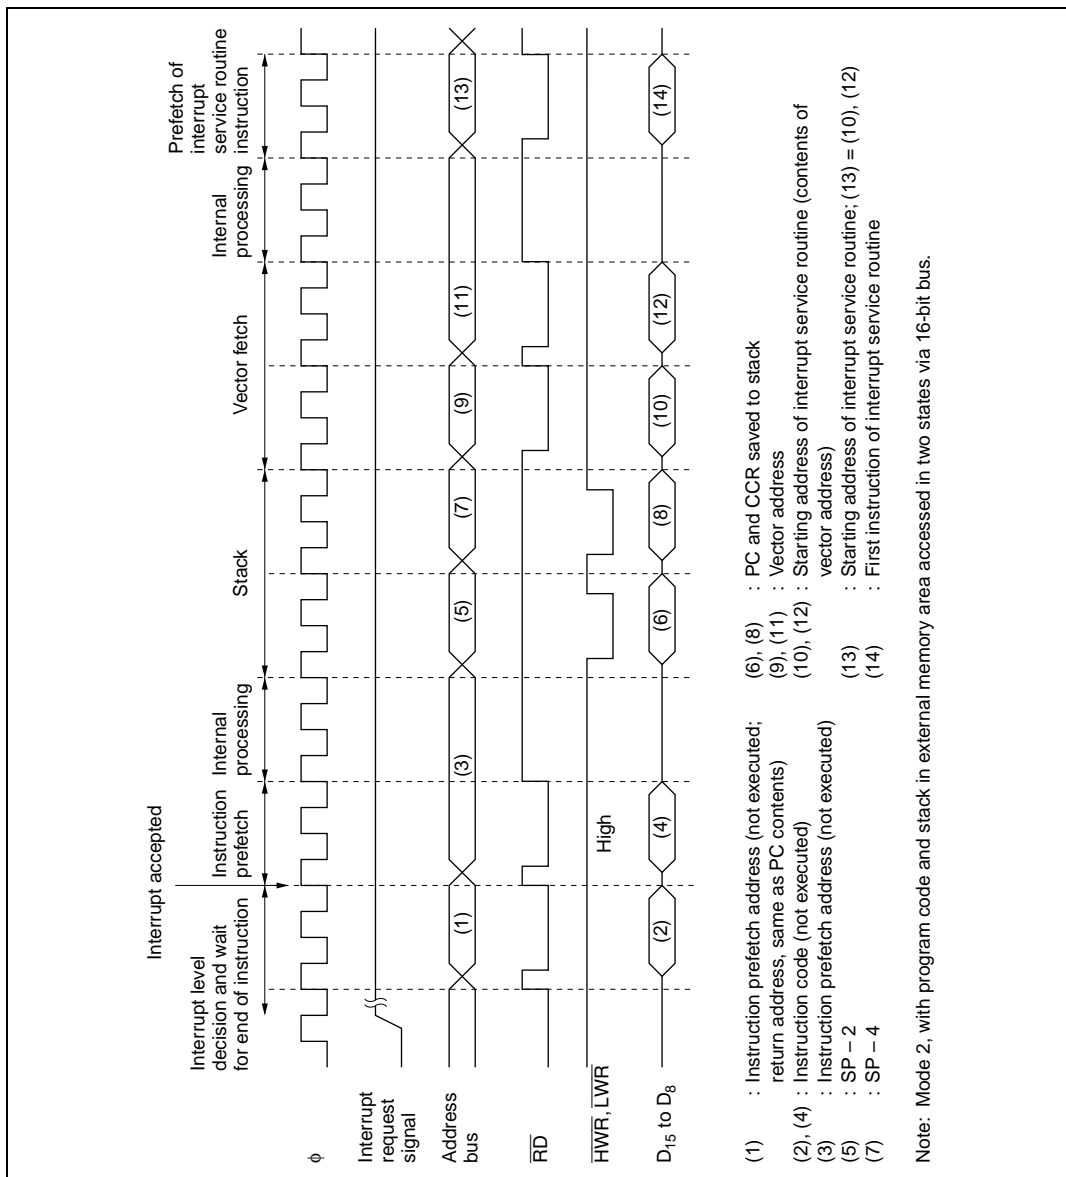

Figure 5.7 Interrupt Exception Handling Sequence

5.4.3 Interrupt Response Time

Table 5.5 indicates the interrupt response time from the occurrence of an interrupt request until the first instruction of the interrupt service routine is executed.

Table 5.5 Interrupt Response Time

No.	Item	On-Chip Memory	External Memory			
			8-Bit Bus		16-Bit Bus	
			2 States	3 States	2 States	3 States
1	Interrupt priority decision	2 ^{*1}	2 ^{*1}	2 ^{*1}	2 ^{*1}	2 ^{*1}
2	Maximum number of states until end of current instruction	1 to 23	1 to 27	1 to 31 ^{*4}	1 to 23	1 to 25 ^{*4}
3	Saving PC and CCR to stack	4	8	12 ^{*4}	4	6 ^{*4}
4	Vector fetch	4	8	12 ^{*4}	4	6 ^{*4}
5	Instruction fetch ^{*2}	4	8	12 ^{*4}	4	6 ^{*4}
6	Internal processing ^{*3}	4	4	4	4	4
Total		19 to 41	31 to 57	43 to 73	19 to 41	25 to 49

- Notes:
- 1 state for internal interrupts
 - Prefetch after the interrupt is accepted and prefetch of the first instruction in the interrupt service routine
 - Internal processing after the interrupt is accepted and internal processing after vector fetch
 - The number of states increases if wait states are inserted in external memory access.

5.5 Usage Notes

5.5.1 Contention between Interrupt and Interrupt-Disabling Instruction

When an instruction clears an interrupt enable bit to 0 to disable the interrupt, the interrupt is not disabled until after execution of the instruction is completed. If an interrupt occurs while a BCLR, MOV, or other instruction is being executed to clear its interrupt enable bit to 0, at the instant when execution of the instruction ends the interrupt is still enabled, so its interrupt exception handling is carried out. If a higher-priority interrupt is also requested, however, interrupt exception handling for the higher-priority interrupt is carried out, and the lower-priority interrupt is ignored. This also applies to the clearing of an interrupt flag to 0.

Figure 5.8 shows an example in which an IMIEA bit is cleared to 0 in the 16-bit timer's TISRA register.

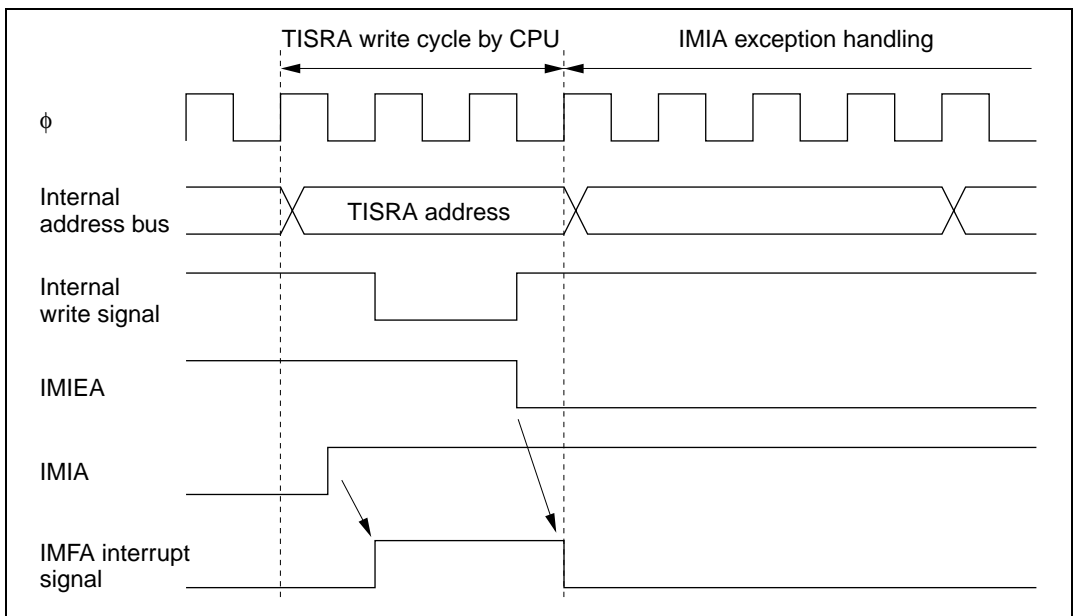

Figure 5.8 Contention between Interrupt and Interrupt-Disabling Instruction

This type of contention will not occur if the interrupt is masked when the interrupt enable bit or flag is cleared to 0.

5.5.2 Instructions that Inhibit Interrupts

The LDC, ANDC, ORC, and XORC instructions inhibit interrupts. When an interrupt occurs, after determining the interrupt priority, the interrupt controller requests a CPU interrupt. If the CPU is currently executing one of these interrupt-inhibiting instructions, however, when the instruction is completed the CPU always continues by executing the next instruction.

5.5.3 Interrupts during EEPMOV Instruction Execution

The EEPMOV.B and EEPMOV.W instructions differ in their reaction to interrupt requests.

When the EEPMOV.B instruction is executing a transfer, no interrupts are accepted until the transfer is completed, not even NMI.

When the EEPMOV.W instruction is executing a transfer, interrupt requests other than NMI are not accepted until the transfer is completed. If NMI is requested, NMI exception handling starts at a transfer cycle boundary. The PC value saved on the stack is the address of the next instruction. Programs should be coded as follows to allow for NMI interrupts during EEPMOV.W execution:

```
L1: EEPMOV.W  
    MOV.W R4,R4  
    BNE L1
```

Section 6 Bus Controller

6.1 Overview

The H8/3062 Group has an on-chip bus controller (BSC) that manages the external address space divided into eight areas. The bus specifications, such as bus width and number of access states, can be set independently for each area, enabling multiple memories to be connected easily.

The bus controller also has a bus arbitration function that controls the operation of the internal bus masters—the CPU can release the bus to an external device.

6.1.1 Features

The features of the bus controller are listed below.

- Manages external address space in area units
 - Manages the external space as eight areas (0 to 7) of 128 kbytes in 1-Mbyte modes, or 2 Mbytes in 16-Mbyte modes
 - Bus specifications can be set independently for each area
- Basic bus interface
 - Chip select (\overline{CS}_0 to \overline{CS}_7) can be output for areas 0 to 7
 - 8-bit access or 16-bit access can be selected for each area
 - Two-state access or three-state access can be selected for each area
 - Program wait states can be inserted for each area
 - Pin wait insertion capability is provided
- Idle cycle insertion
 - An idle cycle can be inserted in case of an external read cycle between different areas
 - An idle cycle can be inserted when an external read cycle is immediately followed by an external write cycle
- Bus arbitration function
 - A built-in bus arbiter grants the bus right to the CPU, or an external bus master
- Other features
 - Choice of two address update modes

6.1.2 Block Diagram

Figure 6.1 shows a block diagram of the bus controller.

Figure 6.1 Block Diagram of Bus Controller

6.1.3 Pin Configuration

Table 6.1 summarizes the input/output pins of the bus controller.

Table 6.1 Bus Controller Pins

Name	Abbreviation	I/O	Function
Chip select 0 to 7	\overline{CS}_0 to \overline{CS}_7	Output	Strobe signals selecting areas 0 to 7
Address strobe	\overline{AS}	Output	Strobe signal indicating valid address output on the address bus
Read	\overline{RD}	Output	Strobe signal indicating reading from the external address space
High write	\overline{HWR}	Output	Strobe signal indicating writing to the external address space, with valid data on the upper data bus (D ₁₅ to D ₈)
Low write	\overline{LWR}	Output	Strobe signal indicating writing to the external address space, with valid data on the lower data bus (D ₇ to D ₀)
Wait	\overline{WAIT}	Input	Wait request signal for access to external three-state access areas
Bus request	\overline{BREQ}	Input	Request signal for releasing the bus to an external device
Bus acknowledge	\overline{BACK}	Output	Acknowledge signal indicating release of the bus to an external device

6.1.4 Register Configuration

Table 6.2 summarizes the bus controller's registers.

Table 6.2 Bus Controller Registers

Address* ¹	Name	Abbreviation	R/W	Initial Value
H'EE020	Bus width control register	ABWCR	R/W	H'FF* ²
H'EE021	Access state control register	ASTCR	R/W	H'FF
H'EE022	Wait control register H	WCRH	R/W	H'FF
H'EE023	Wait control register L	WCRL	R/W	H'FF
H'EE013	Bus release control register	BRCR	R/W	H'FE* ³
H'EE01F	Chip select control register	CSCR	R/W	H'0F
H'EE01E	Address control register	ADRCR	R/W	H'FF
H'EE024	Bus control register	BCR	R/W	H'C6

Notes: 1. Lower 20 bits of the address in advanced mode

2. In modes 2 and 4, the initial value is H'00.

3. In modes 3 and 4, the initial value is H'EE.

6.2 Register Descriptions

6.2.1 Bus Width Control Register (ABWCR)

ABWCR is an 8-bit readable/writable register that selects 8-bit or 16-bit access for each area.

Bit		7	6	5	4	3	2	1	0
		ABW7	ABW6	ABW5	ABW4	ABW3	ABW2	ABW1	ABW0
Modes 1, 3, 5, 6, and 7	Initial value	1	1	1	1	1	1	1	1
	Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Modes 2 and 4	Initial value	0	0	0	0	0	0	0	0
	Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When ABWCR contains H'FF (selecting 8-bit access for all areas), the chip operates in 8-bit bus mode: the upper data bus (D₁₅ to D₈) is valid, and port 4 is an input/output port. When at least one bit is cleared to 0 in ABWCR, the chip operates in 16-bit bus mode with a 16-bit data bus (D₁₅ to D₀). In modes 1, 3, 5, 6, and 7, ABWCR is initialized to H'FF by a reset and in hardware standby mode. In modes 2 and 4, ABWCR is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Area 7 to 0 Bus Width Control (ABW7 to ABW0): These bits select 8-bit access or 16-bit access for the corresponding areas.

Bits 7 to 0

ABW7 to ABW0 Description

ABW7 to ABW0	Description
0	Areas 7 to 0 are 16-bit access areas
1	Areas 7 to 0 are 8-bit access areas

ABWCR specifies the data bus width of external memory areas. The data bus width of on-chip memory and registers is fixed, and does not depend on ABWCR settings. These settings are therefore invalid in the single-chip modes (modes 6 and 7).

6.2.2 Access State Control Register (ASTCR)

ASTCR is an 8-bit readable/writable register that selects whether each area is accessed in two states or three states.

Bit	7	6	5	4	3	2	1	0
	AST7	AST6	AST5	AST4	AST3	AST2	AST1	AST0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits selecting number of states for access to each area

ASTCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Area 7 to 0 Access State Control (AST7 to AST0): These bits select whether the corresponding area is accessed in two or three states.

Bits 7 to 0

AST7 to AST0	Description
0	Areas 7 to 0 are accessed in two states
1	Areas 7 to 0 are accessed in three states (Initial value)

ASTCR specifies the number of states in which external areas are accessed. On-chip memory and registers are accessed in a fixed number of states that does not depend on ASTCR settings. These settings are therefore meaningless in the single-chip modes (modes 6 and 7).

6.2.3 Wait Control Registers H and L (WCRH, WCRL)

WCRH and WCRL are 8-bit readable/writable registers that select the number of program wait states for each area.

On-chip memory and registers are accessed in a fixed number of states that does not depend on WCRH/WCRL settings.

WCRH and WCRL are initialized to H'FF by a reset and in hardware standby mode. They are not initialized in software standby mode.

WCRH

Bit	7	6	5	4	3	2	1	0
	W71	W70	W61	W60	W51	W50	W41	W40
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 7 and 6—Area 7 Wait Control 1 and 0 (W71, W70): These bits select the number of program wait states when area 7 in external space is accessed while the AST7 bit in ASTCR is set to 1.

Bit 7 W71	Bit 6 W70	Description
0	0	Program wait not inserted when external space area 7 is accessed
	1	1 program wait state inserted when external space area 7 is accessed
1	0	2 program wait states inserted when external space area 7 is accessed
	1	3 program wait states inserted when external space area 7 is accessed (Initial value)

Bits 5 and 4—Area 6 Wait Control 1 and 0 (W61, W60): These bits select the number of program wait states when area 6 in external space is accessed while the AST6 bit in ASTCR is set to 1.

Bit 5 W61	Bit 4 W60	Description
0	0	Program wait not inserted when external space area 6 is accessed
	1	1 program wait state inserted when external space area 6 is accessed
1	0	2 program wait states inserted when external space area 6 is accessed
	1	3 program wait states inserted when external space area 6 is accessed (Initial value)

Bits 3 and 2—Area 5 Wait Control 1 and 0 (W51, W50): These bits select the number of program wait states when area 5 in external space is accessed while the AST5 bit in ASTCR is set to 1.

Bit 3 W51	Bit 2 W50	Description
0	0	Program wait not inserted when external space area 5 is accessed
	1	1 program wait state inserted when external space area 5 is accessed
1	0	2 program wait states inserted when external space area 5 is accessed
	1	3 program wait states inserted when external space area 5 is accessed (Initial value)

Bits 1 and 0—Area 4 Wait Control 1 and 0 (W41, W40): These bits select the number of program wait states when area 4 in external space is accessed while the AST4 bit in ASTCR is set to 1.

Bit 1 W41	Bit 0 W40	Description
0	0	Program wait not inserted when external space area 4 is accessed
	1	1 program wait state inserted when external space area 4 is accessed
1	0	2 program wait states inserted when external space area 4 is accessed
	1	3 program wait states inserted when external space area 4 is accessed (Initial value)

WCRL

Bit	7	6	5	4	3	2	1	0
	W31	W30	W21	W20	W11	W10	W01	W00
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 7 and 6—Area 3 Wait Control 1 and 0 (W31, W30): These bits select the number of program wait states when area 3 in external space is accessed while the AST3 bit in ASTCR is set to 1.

Bit 7 W31	Bit 6 W30	Description
0	0	Program wait not inserted when external space area 3 is accessed
	1	1 program wait state inserted when external space area 3 is accessed
1	0	2 program wait states inserted when external space area 3 is accessed
	1	3 program wait states inserted when external space area 3 is accessed (Initial value)

Bits 5 and 4—Area 2 Wait Control 1 and 0 (W21, W20): These bits select the number of program wait states when area 2 in external space is accessed while the AST2 bit in ASTCR is set to 1.

Bit 5 W21	Bit 4 W20	Description
0	0	Program wait not inserted when external space area 2 is accessed
	1	1 program wait state inserted when external space area 2 is accessed
1	0	2 program wait states inserted when external space area 2 is accessed
	1	3 program wait states inserted when external space area 2 is accessed (Initial value)

Bits 3 and 2—Area 1 Wait Control 1 and 0 (W11, W10): These bits select the number of program wait states when area 1 in external space is accessed while the AST1 bit in ASTCR is set to 1.

Bit 3 W11	Bit 2 W10	Description
0	0	Program wait not inserted when external space area 1 is accessed
	1	1 program wait state inserted when external space area 1 is accessed
1	0	2 program wait states inserted when external space area 1 is accessed
	1	3 program wait states inserted when external space area 1 is accessed (Initial value)

Bits 1 and 0—Area 0 Wait Control 1 and 0 (W01, W00): These bits select the number of program wait states when area 0 in external space is accessed while the AST0 bit in ASTCR is set to 1.

Bit 1 W01	Bit 0 W00	Description
0	0	Program wait not inserted when external space area 0 is accessed
	1	1 program wait state inserted when external space area 0 is accessed
1	0	2 program wait states inserted when external space area 0 is accessed
	1	3 program wait states inserted when external space area 0 is accessed (Initial value)

6.2.4 Bus Release Control Register (BRCR)

BRCR is an 8-bit readable/writable register that enables address output on bus lines A_{23} to A_{20} and enables or disables release of the bus to an external device.

Bit	7	6	5	4	3	2	1	0
	A23E	A22E	A21E	A20E	—	—	—	BRLE
Modes 1, 2, 6, and 7	Initial value	1	1	1	1	1	1	0
	Read/Write	—	—	—	—	—	—	R/W
Modes 3 and 4	Initial value	1	1	0	1	1	1	0
	Read/Write	R/W	R/W	R/W	—	—	—	R/W
Mode 5	Initial value	1	1	1	1	1	1	0
	Read/Write	R/W	R/W	R/W	R/W	—	—	R/W

<p>Address 23 to 20 enable These bits enable PA_7 to PA_4 to be used for A_{23} to A_{20} address output</p>	<p>Reserved bits</p> <p>Bus release enable Enables or disables release of the bus to an external device</p>
---	---

BRCR is initialized to H'FE in modes 1, 2, 5, 6, and 7, and to H'EE in modes 3 and 4, by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—Address 23 Enable (A23E): Enables PA_4 to be used as the A_{23} address output pin.

Writing 0 in this bit enables A_{23} output from PA_4 . In modes other than 3, 4, and 5, this bit cannot be modified and PA_4 has its ordinary port functions.

Bit 7

A23E	Description
0	PA_4 is the A_{23} address output pin
1	PA_4 is an input/output pin (Initial value)

Bit 6—Address 22 Enable (A22E): Enables PA₅ to be used as the A₂₂ address output pin. Writing 0 in this bit enables A₂₂ output from PA₅. In modes other than 3, 4, and 5, this bit cannot be modified and PA₅ has its ordinary port functions.

Bit 6 A22E	Description
0	PA ₅ is the A ₂₂ address output pin
1	PA ₅ is an input/output pin (Initial value)

Bit 5—Address 21 Enable (A21E): Enables PA₆ to be used as the A₂₁ address output pin. Writing 0 in this bit enables A₂₁ output from PA₆. In modes other than 3, 4, and 5, this bit cannot be modified and PA₆ has its ordinary port functions.

Bit 5 A21E	Description
0	PA ₆ is the A ₂₁ address output pin
1	PA ₆ is an input/output pin (Initial value)

Bit 4—Address 20 Enable (A20E): Enables PA₇ to be used as the A₂₀ address output pin. Writing 0 in this bit enables A₂₀ output from PA₇. This bit can only be modified in mode 5.

Bit 4 A20E	Description
0	PA ₇ is the A ₂₀ address output pin (Initial value when in mode 3 or 4)
1	PA ₇ is an input/output pin (Initial value when in mode 1, 2, 5, 6 or 7)

Bits 3 to 1—Reserved: These bits cannot be modified and are always read as 1.

Bit 0—Bus Release Enable (BRLE): Enables or disables release of the bus to an external device.

Bit 0 BRLE	Description
0	The bus cannot be released to an external device BREQ and BACK can be used as input/output pins (Initial value)
1	The bus can be released to an external device

6.2.5 Bus Control Register (BCR)

Bit	7	6	5	4	3	2	1	0
	ICIS1	ICIS0	—	—	—	—	RDEA	WAITE
Initial value	1	1	0*	0*	0*	1	1	0
Read/Write	R/W	R/W	—	—	—	—	R/W	R/W

Note: * 1 must not be written in bits 5 to 3.

BCR is an 8-bit readable/writable register that enables or disables idle cycle insertion, selects the area division unit, and enables or disables $\overline{\text{WAIT}}$ pin input.

BCR is initialized to H'C6 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—Idle Cycle Insertion 1 (ICIS1): Selects whether one idle cycle state is to be inserted between bus cycles in case of consecutive external read cycles for different areas.

Bit 7

ICIS1	Description
0	No idle cycle inserted in case of consecutive external read cycles for different areas
1	Idle cycle inserted in case of consecutive external read cycles for different areas (Initial value)

Bit 6—Idle Cycle Insertion 0 (ICIS0): Selects whether one idle cycle state is to be inserted between bus cycles in case of consecutive external read and write cycles.

Bit 6

ICIS0	Description
0	No idle cycle inserted in case of consecutive external read and write cycles
1	Idle cycle inserted in case of consecutive external read and write cycles (Initial value)

Bits 5 to 3—Reserved (must not be set to 1): These bits can be read and written, but must not be set to 1. Normal operation cannot be guaranteed if 1 is written in these bits.

Bit 2—Reserved: Read-only bit, always read as 1.

Bit 1—Area Division Unit Select (RDEA): Selects the memory map area division units. This bit is valid in modes 3, 4, and 5, and is invalid in modes 1, 2, 6, and 7.

Bit 1 RDEA	Description								
0	Area divisions are as follows: <table style="margin-left: 20px; border: none;"> <tr> <td style="padding-right: 20px;">Area 0: 2 Mbytes</td> <td>Area 4: 1.93 Mbytes</td> </tr> <tr> <td style="padding-right: 20px;">Area 1: 2 Mbytes</td> <td>Area 5: 4 kbytes</td> </tr> <tr> <td style="padding-right: 20px;">Area 2: 8 Mbytes</td> <td>Area 6: 23.75 kbytes (19.75 kbytes)*</td> </tr> <tr> <td style="padding-right: 20px;">Area 3: 2 Mbytes</td> <td>Area 7: 22 bytes</td> </tr> </table>	Area 0: 2 Mbytes	Area 4: 1.93 Mbytes	Area 1: 2 Mbytes	Area 5: 4 kbytes	Area 2: 8 Mbytes	Area 6: 23.75 kbytes (19.75 kbytes)*	Area 3: 2 Mbytes	Area 7: 22 bytes
Area 0: 2 Mbytes	Area 4: 1.93 Mbytes								
Area 1: 2 Mbytes	Area 5: 4 kbytes								
Area 2: 8 Mbytes	Area 6: 23.75 kbytes (19.75 kbytes)*								
Area 3: 2 Mbytes	Area 7: 22 bytes								
1	Areas 0 to 7 are the same size (2 Mbytes) (Initial value)								

Note: * Division in the H8/3064F-ZTAT B-mask version.

Bit 0—WAIT Pin Enable (WAITE): Enables or disables wait insertion by means of the $\overline{\text{WAIT}}$ pin.

Bit 0 WAITE	Description
0	$\overline{\text{WAIT}}$ pin wait input is disabled, and the $\overline{\text{WAIT}}$ pin can be used as an input/output port (Initial value)
1	$\overline{\text{WAIT}}$ pin wait input is enabled

6.2.6 Chip Select Control Register (CSCR)

CSCR is an 8-bit readable/writable register that enables or disables output of chip select signals (\overline{CS}_7 to \overline{CS}_4).

If output of a chip select signal \overline{CS}_7 to \overline{CS}_4 is enabled by a setting in this register, the corresponding pin functions a chip select signal (\overline{CS}_7 to \overline{CS}_4) output regardless of any other settings. CSCR cannot be modified in single-chip mode.

Bit	7	6	5	4	3	2	1	0
	CS7E	CS6E	CS5E	CS4E	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Chip select 7 to 4 enable
These bits enable or disable
chip select signal output
Reserved bits

CSCR is initialized to H'0F by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Chip Select 7 to 4 Enable (CS7E to CS4E): These bits enable or disable output of the corresponding chip select signal.

Bit n CSnE	Description
0	Output of chip select signal \overline{CS}_n is disabled (Initial value)
1	Output of chip select signal \overline{CS}_n is enabled

Note: n = 7 to 4

Bits 3 to 0—Reserved: These bits cannot be modified and are always read as 1.

6.2.7 Address Control Register (ADRCR)

ADRCR is an 8-bit readable/writable register that selects either address update mode 1 or address update mode 2 as the address output method.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADRCTL
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	R/W

Reserved bits
Address control
Selects address
update mode 1 or
address update
mode 2

ADRCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 1—Reserved: Read-only bits, always read as 1.

Bit 0—Address Control (ADRCTL): Selects the address output method.

Bit 0

ADRCTL	Description
0	Address update mode 2 is selected
1	Address update mode 1 is selected (Initial value)

6.3 Operation

6.3.1 Area Division

The external address space is divided into areas 0 to 7. Each area has a size of 128 kbytes in the 1-Mbyte modes, or 2 Mbytes in the 16-Mbyte modes. Figure 6.2 shows a general view of the memory map.

H'00000	Area 0 (128 kbytes)	H'000000	Area 0 (2 Mbytes)
H'1FFFF		H'1FFFFFF	
H'20000	Area 1 (128 kbytes)	H'200000	Area 1 (2 Mbytes)
H'3FFFF		H'3FFFFFF	
H'40000	Area 2 (128 kbytes)	H'400000	Area 2 (2 Mbytes)
H'5FFFF		H'5FFFFFF	
H'60000	Area 3 (128 kbytes)	H'600000	Area 3 (2 Mbytes)
H'7FFFF		H'7FFFFFF	
H'80000	Area 4 (128 kbytes)	H'800000	Area 4 (2 Mbytes)
H'9FFFF		H'9FFFFFF	
H'A0000	Area 5 (128 kbytes)	H'A00000	Area 5 (2 Mbytes)
H'BFFFF		H'BFFFFFF	
H'C0000	Area 6 (128 kbytes)	H'C00000	Area 6 (2 Mbytes)
H'DFFFF		H'DFFFFFF	
H'E0000	Area 7 (128 Mbytes)	H'E00000	Area 7 (2 Mbytes)
H'FFFFFF		H'FFFFFFF	
(a) 1-Mbyte modes (modes 1 and 2)		(b) 16-Mbyte modes (modes 3 to 5)	

Figure 6.2 Access Area Map for Each Operating Mode

Chip select signals (\overline{CS}_0 to \overline{CS}_7) can be output for areas 0 to 7. The bus specifications for each area are selected in ABWCR, ASTCR, WCRH, and WCRL.

In 16-Mbyte mode, the area division units can be selected with the RDEA bit in BCR.

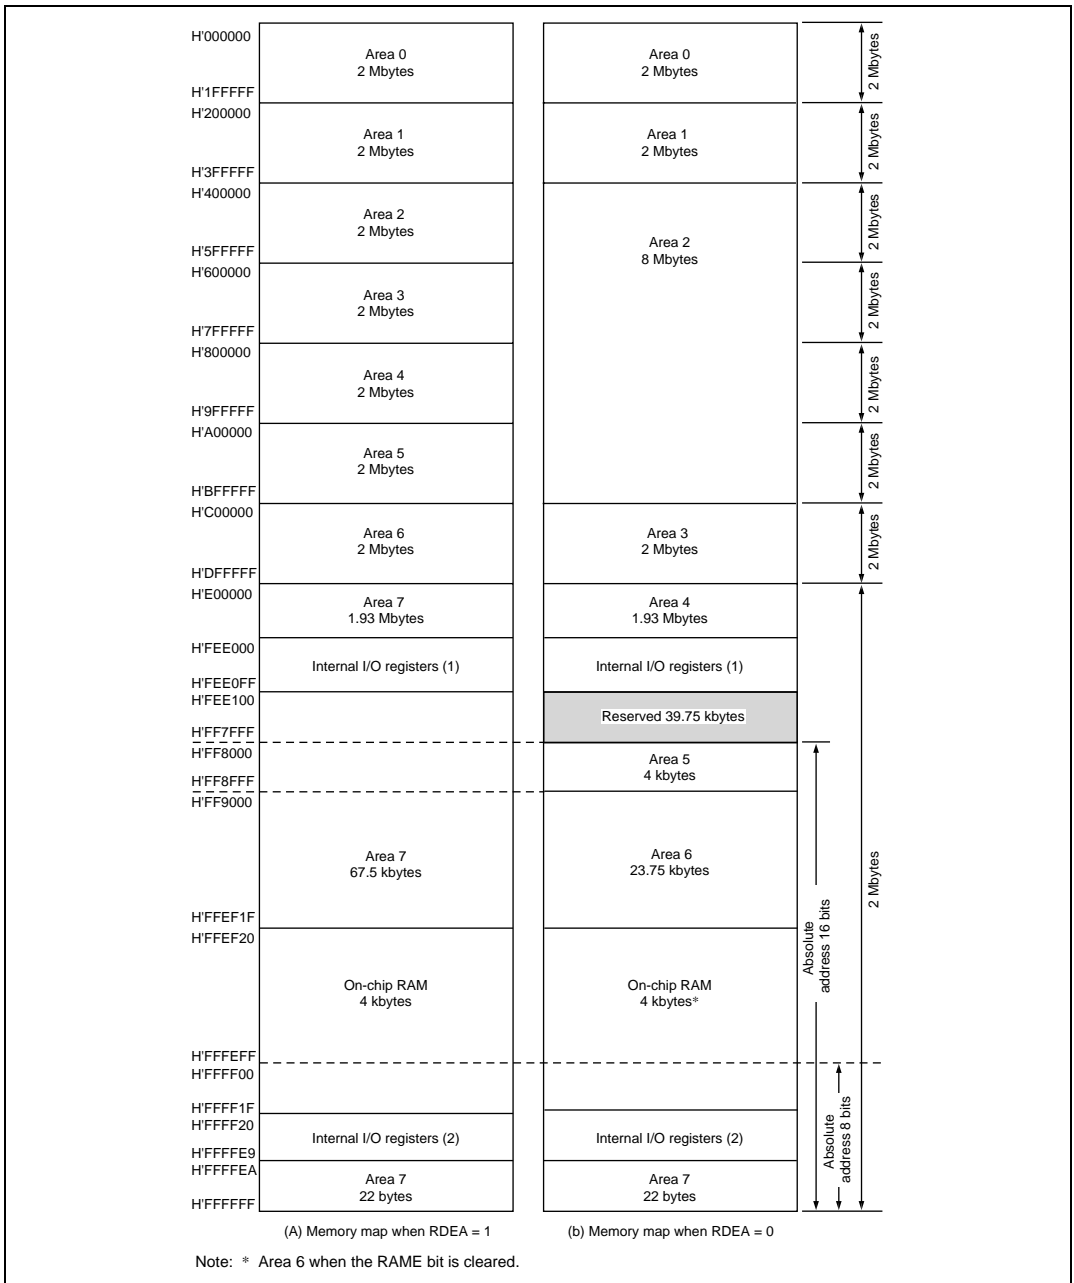

Figure 6.3 Memory Map in 16-Mbyte Mode (H8/3062F-ZTAT R-Mask Version, H8/3062F-ZTAT B-Mask Version, H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version) (1)

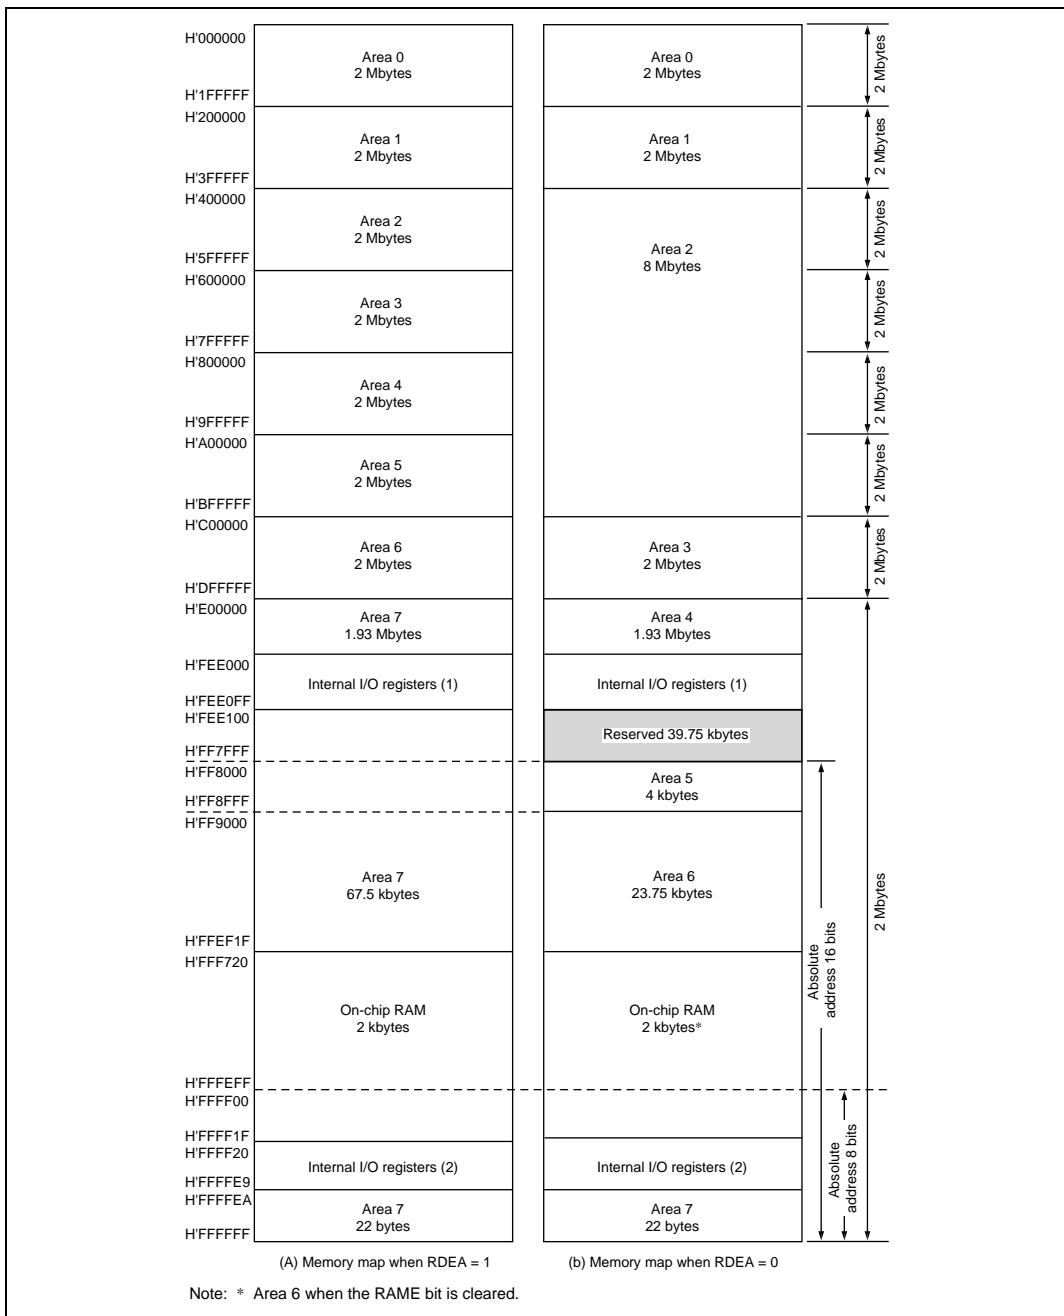

Figure 6.3 Memory Map in 16-Mbyte Mode
(H8/3060 Masked ROM Version, H8/3060 Masked ROM B-Mask Version) (2)

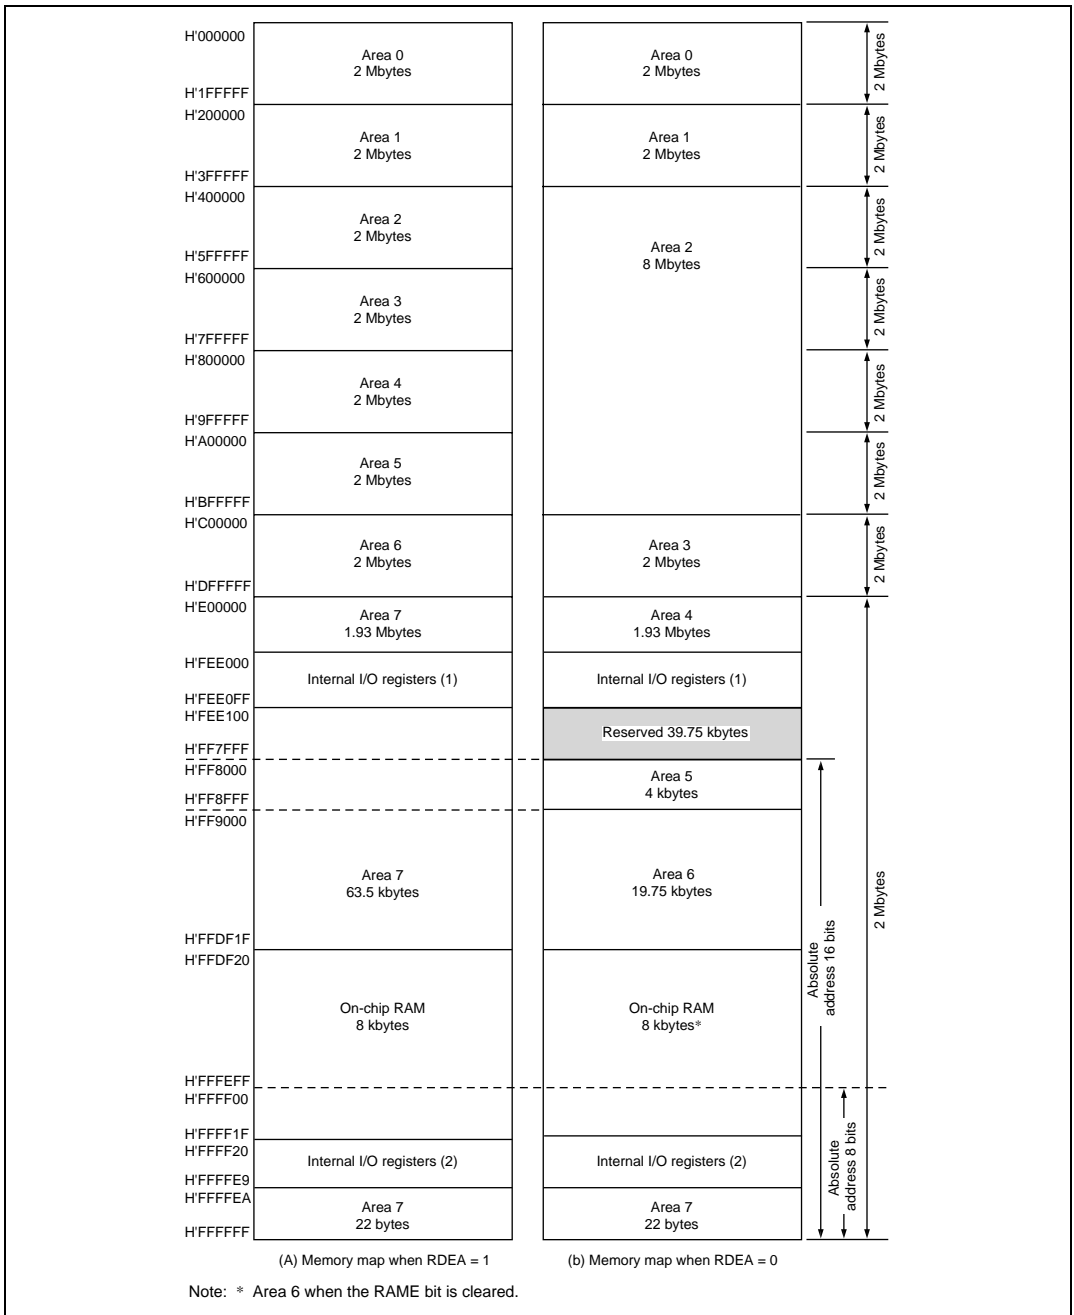

Figure 6.3 Memory Map in 16-Mbyte Mode
(H8/3064F-ZTAT B-Mask Version, H8/3064 Masked ROM B-Mask Version) (3)

6.3.2 Bus Specifications

The external space bus specifications consist of three elements: bus width, number of access states, and number of program wait states.

The bus width and number of access states for on-chip memory and registers are fixed, and are not affected by the bus controller.

Bus Width: A bus width of 8 or 16 bits can be selected with ABWCR. An area for which an 8-bit bus is selected functions as an 8-bit access space, and an area for which a 16-bit bus is selected functions as a 16-bit access space.

If all areas are designated for 8-bit access, 8-bit bus mode is set; if any area is designated for 16-bit access, 16-bit bus mode is set.

Number of Access States: Two or three access states can be selected with ASTCR. An area for which two-state access is selected functions as a two-state access space, and an area for which three-state access is selected functions as a three-state access space.

When two-state access space is designated, wait insertion is disabled.

Number of Program Wait States: When three-state access space is designated in ASTCR, the number of program wait states to be inserted automatically is selected with WCRH and WCRL. From 0 to 3 program wait states can be selected.

Table 6.3 shows the bus specifications for each basic bus interface area.

Table 6.3 Bus Specifications for Each Area (Basic Bus Interface)

ABWCR	ASTCR	WCRH/WCRL		Bus Specifications (Basic Bus Interface)		
		Wn1	Wn0	Bus Width	Access States	Program Wait States
0	0	—	—	16	2	0
	1	0	0		3	0
			1		1	
			0		2	
			1		3	
1	0	—	—	8	2	0
	1	0	0		3	0
			1		1	
			0		2	
			1		3	

Note: n = 0 to 7

6.3.3 Memory Interfaces

As its memory interface, the H8/3062 Group has only a basic bus interface that allows direct connection of ROM, SRAM, and so on. It is not possible to select a DRAM interface that allows direct connection of DRAM, or a burst ROM interface that allows direct connection of burst ROM.

6.3.4 Chip Select Signals

For each of areas 0 to 7, the H8/3062 Group can output a chip select signal (\overline{CS}_0 to \overline{CS}_7) that goes low when the corresponding area is selected in expanded mode. Figure 6.4 shows the output timing of a \overline{CS}_n signal.

Output of \overline{CS}_0 to \overline{CS}_3 : Output of \overline{CS}_0 to \overline{CS}_3 is enabled or disabled in the data direction register (DDR) of the corresponding port.

In the expanded modes with on-chip ROM disabled, a reset leaves pin \overline{CS}_0 in the output state and pins \overline{CS}_1 to \overline{CS}_3 in the input state. To output chip select signals \overline{CS}_1 to \overline{CS}_3 , the corresponding DDR bits must be set to 1. In the expanded modes with on-chip ROM enabled, a reset leaves pins \overline{CS}_0 to \overline{CS}_3 in the input state. To output chip select signals \overline{CS}_0 to \overline{CS}_3 , the corresponding DDR bits must be set to 1. For details, see section 7, I/O Ports.

Output of \overline{CS}_4 to \overline{CS}_7 : Output of \overline{CS}_4 to \overline{CS}_7 is enabled or disabled in the chip select control register (CSCR). A reset leaves pins \overline{CS}_4 to \overline{CS}_7 in the input state. To output chip select signals \overline{CS}_4 to \overline{CS}_7 , the corresponding CSCR bits must be set to 1. For details, see section 7, I/O Ports.

Figure 6.4 \overline{CS}_n Signal Output Timing (n = 0 to 7)

When the on-chip ROM, on-chip RAM, and internal I/O registers are accessed, \overline{CS}_0 to \overline{CS}_7 remain high. The \overline{CS}_n signals are decoded from the address signals. They can be used as chip select signals for SRAM and other devices.

6.3.5 Address Output Method

The H8/3062F-ZTAT R-mask version, H8/3062F-ZTAT B-mask version, H8/3062 masked ROM version, H8/3061 masked ROM version, H8/3060 masked ROM version, and H8/3064F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version provide a choice of two address update methods: either the same method as in the previous H8/300H Series (address update mode 1), or a method in which address updating is restricted to external space accesses (address update mode 2).

Figure 6.5 shows examples of address output in these two update modes.

**Figure 6.5 Sample Address Output in Each Address Update Mode
(Basic Bus Interface, 3-State Space)**

Address Update Mode 1: Address update mode 1 is compatible with the previous H8/300H Series. Addresses are always updated between bus cycles.

Address Update Mode 2: In address update mode 2, address updating is performed only in external space accesses. In this mode, the address can be retained between an external space read cycle and an instruction fetch cycle (on-chip memory) by placing the program in on-chip memory. Address update mode 2 is therefore useful when connecting a device that requires address hold time with respect to the rise of the \overline{RD} strobe.

Switching between address update modes 1 and 2 is performed by means of the ADRCTL bit in ADRCCR. The initial value of ADRCCR is the address update mode 1 setting, providing compatibility with the previous H8/300H Series.

- When address update mode 2 is selected, the address in an internal space (on-chip memory or internal I/O) access cycle is not output externally.
- In order to secure address holding with respect to the rise of \overline{RD} , when address update mode 2 is used an external space read access must be completed within a single access cycle. For example, in a word access to 8-bit access space, the bus cycle is split into two as shown in figure 6.6., and so there is not a single access cycle. In this case, address holding is not guaranteed at the rise of \overline{RD} between the first (even address) and second (odd address) access cycles (area inside the ellipse in the figure).

Figure 6.6 Example of Consecutive External Space Accesses in Address Update Mode 2

6.4 Basic Bus Interface

6.4.1 Overview

The basic bus interface enables direct connection of ROM, SRAM, and so on.

The bus specifications can be selected with ABWCR, ASTCR, WCRH, and WCRL (see table 6.3).

6.4.2 Data Size and Data Alignment

Data sizes for the CPU and other internal bus masters are byte, word, and longword. The bus controller has a data alignment function, and when accessing external space, controls whether the upper data bus (D_{15} to D_8) or lower data bus (D_7 to D_0) is used according to the bus specifications for the area being accessed (8-bit access area or 16-bit access area) and the data size.

8-Bit Access Areas: Figure 6.7 illustrates data alignment control for 8-bit access space. With 8-bit access space, the upper data bus (D_{15} to D_8) is always used for accesses. The amount of data that can be accessed at one time is one byte: a word access is performed as two byte accesses, and a longword access, as four byte accesses.

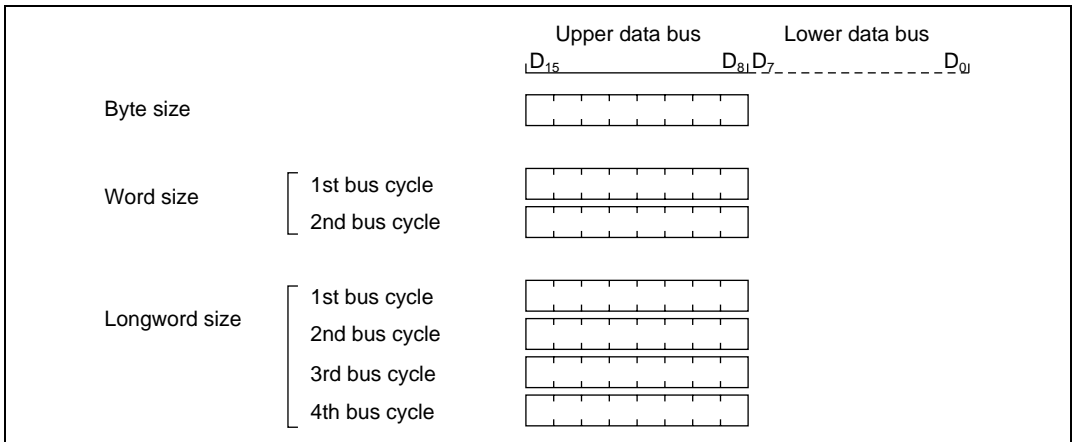

Figure 6.7 Access Sizes and Data Alignment Control (8-Bit Access Area)

16-Bit Access Areas: Figure 6.8 illustrates data alignment control for 16-bit access areas. With 16-bit access areas, the upper data bus (D_{15} to D_8) and lower data bus (D_7 to D_0) are used for accesses. The amount of data that can be accessed at one time is one byte or one word, and a longword access is executed as two word accesses.

In byte access, whether the upper or lower data bus is used is determined by whether the address is even or odd. The upper data bus is used for an even address, and the lower data bus for an odd address.

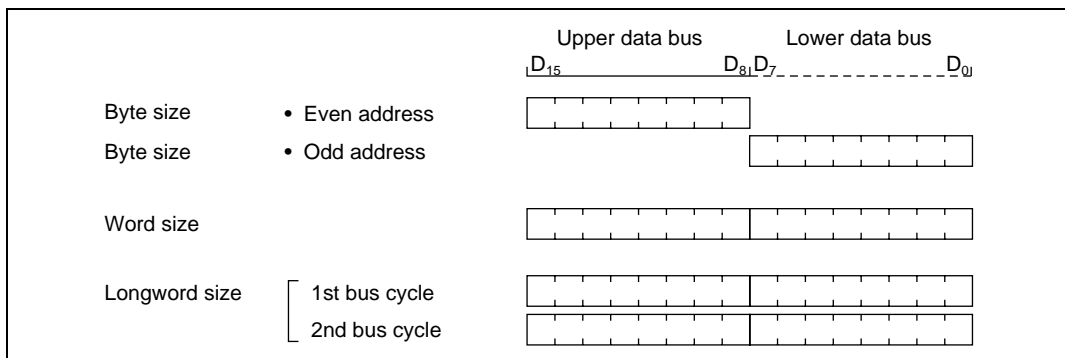

Figure 6.8 Access Sizes and Data Alignment Control (16-Bit Access Area)

6.4.3 Valid Strobes

Table 6.4 shows the data buses used, and the valid strobes, for the access spaces.

In a read, the \overline{RD} signal is valid for both the upper and the lower half of the data bus.

In a write, the \overline{HWR} signal is valid for the upper half of the data bus, and the \overline{LWR} signal for the lower half.

Table 6.4 Data Buses Used and Valid Strobes

Area	Access Size	Read/Write	Address	Valid Strobe	Upper Data Bus (D ₁₅ to D ₈)	Lower Data Bus (D ₇ to D ₀)
8-bit access area	Byte	Read	—	\overline{RD}	Valid	Invalid
		Write	—	\overline{HWR}		Undetermined data
16-bit access area	Byte	Read	Even	\overline{RD}	Valid	Invalid
			Odd		Invalid	Valid
		Write	Even	\overline{HWR}	Valid	Undetermined data
			Odd	\overline{LWR}	Undetermined data	Valid
	Word	Read	—	\overline{RD}	Valid	Valid
		Write	—		\overline{HWR} , \overline{LWR}	Valid

Notes: 1. Undetermined data means that unpredictable data is output.
 2. Invalid means that the bus is in the input state and the input is ignored.

6.4.4 Memory Areas

The initial state of each area is basic bus interface, three-state access space. The initial bus width is selected according to the operating mode.

Area 0: Area 0 includes on-chip ROM, and in ROM-disabled expansion mode, all of area 0 is external space. In ROM-enabled expansion mode, the space excluding on-chip ROM is external space.

When area 0 external space is accessed, the \overline{CS}_0 signal can be output.

The size of area 0 is 128 kbytes in modes 1 and 2, and 2 Mbytes in modes 3 to 5.

Areas 1 to 6: In external expansion mode, areas 1 to 6 are entirely external space.

When area 1 to 6 external space is accessed, the \overline{CS}_1 to \overline{CS}_6 pin signals respectively can be output.

The size of areas 1 to 6 is 128 kbytes in modes 1 and 2, and 2 Mbytes in modes 3 to 5.

Area 7: Area 7 includes the on-chip RAM and registers. In external expansion mode, the space excluding the on-chip RAM and registers is external space. The on-chip RAM is enabled when the RAME bit in the system control register (SYSCR) is set to 1; when the RAME bit is cleared to 0, the on-chip RAM is disabled and the corresponding space becomes external space.

When area 7 external space is accessed, the \overline{CS}_7 signal can be output.

The size of area 7 is 128 kbytes in modes 1 and 2, and 2 Mbytes in modes 3 to 5.

6.4.5 Basic Bus Control Signal Timing

8-Bit, Three-State-Access Areas: Figure 6.9 shows the timing of bus control signals for an 8-bit, three-state-access area. The upper data bus (D_{15} to D_8) is used in accesses to these areas. The \overline{LWR} pin is always high. Wait states can be inserted.

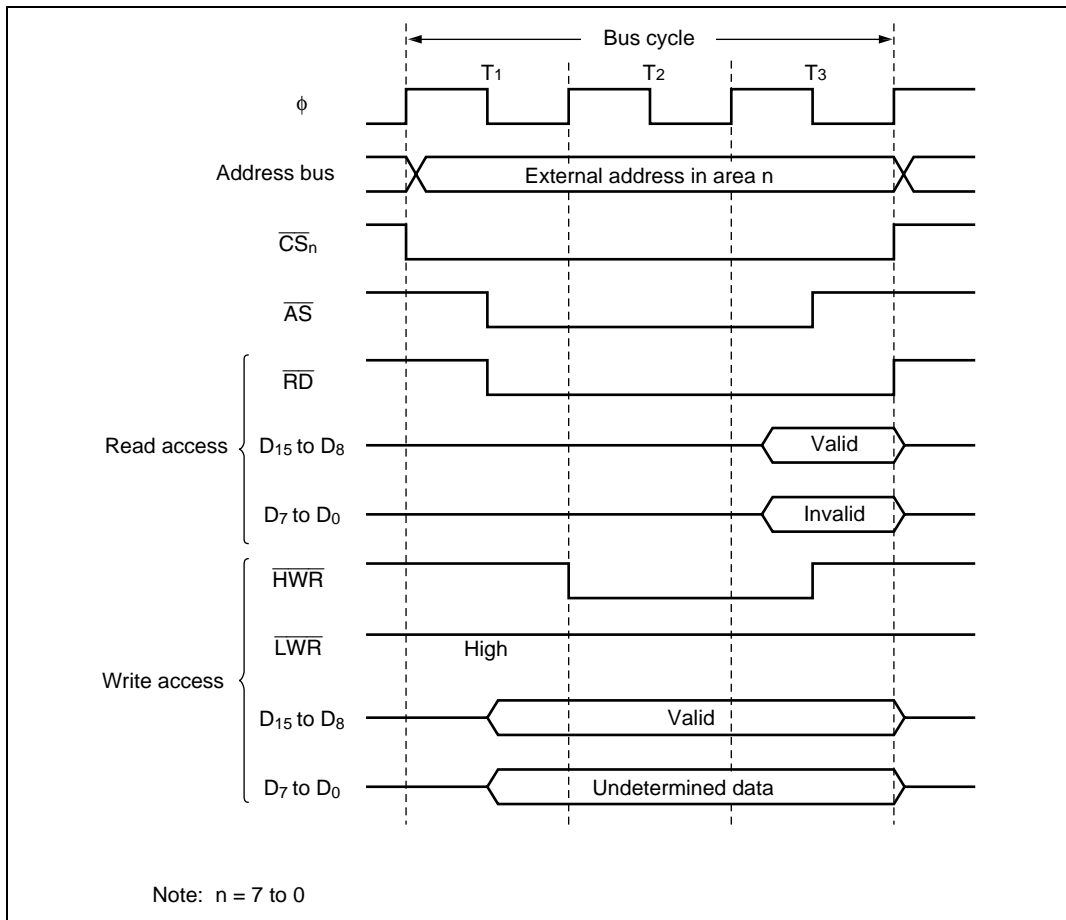

Figure 6.9 Bus Control Signal Timing for 8-Bit, Three-State-Access Area

8-Bit, Two-State-Access Areas: Figure 6.10 shows the timing of bus control signals for an 8-bit, two-state-access area. The upper data bus (D_{15} to D_8) is used in accesses to these areas. The \overline{LWR} pin is always high. Wait states cannot be inserted.

Figure 6.10 Bus Control Signal Timing for 8-Bit, Two-State-Access Area

16-Bit, Three-State-Access Areas: Figures 6.11 to 6.13 show the timing of bus control signals for a 16-bit, three-state-access area. In these areas, the upper data bus (D_{15} to D_8) is used in accesses to even addresses and the lower data bus (D_7 to D_0) in accesses to odd addresses. Wait states can be inserted.

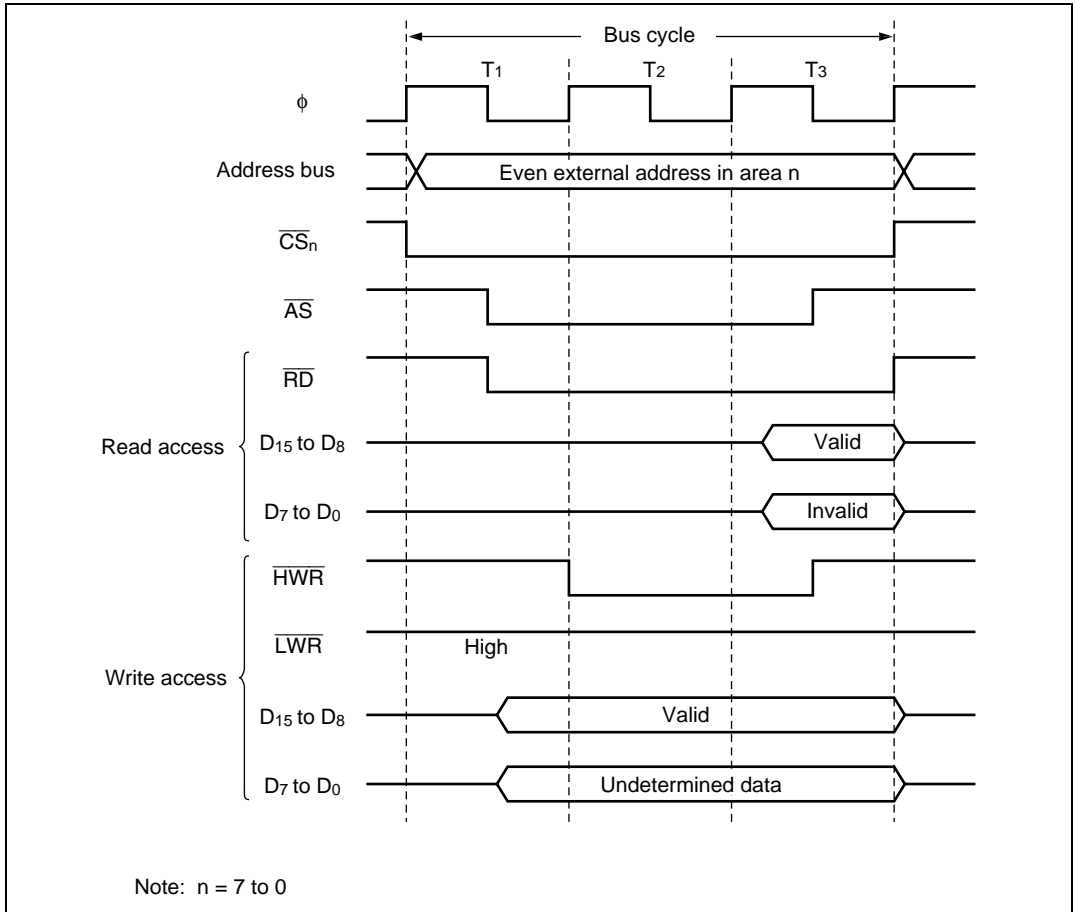

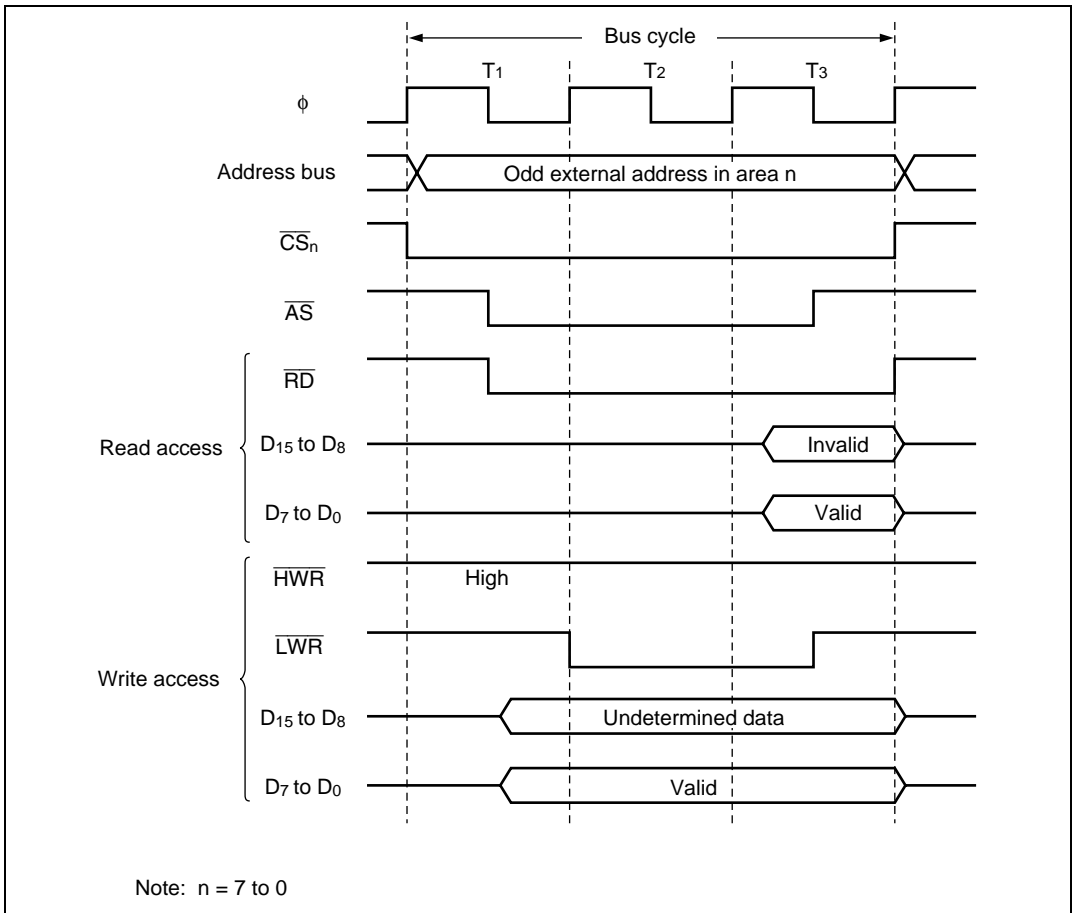

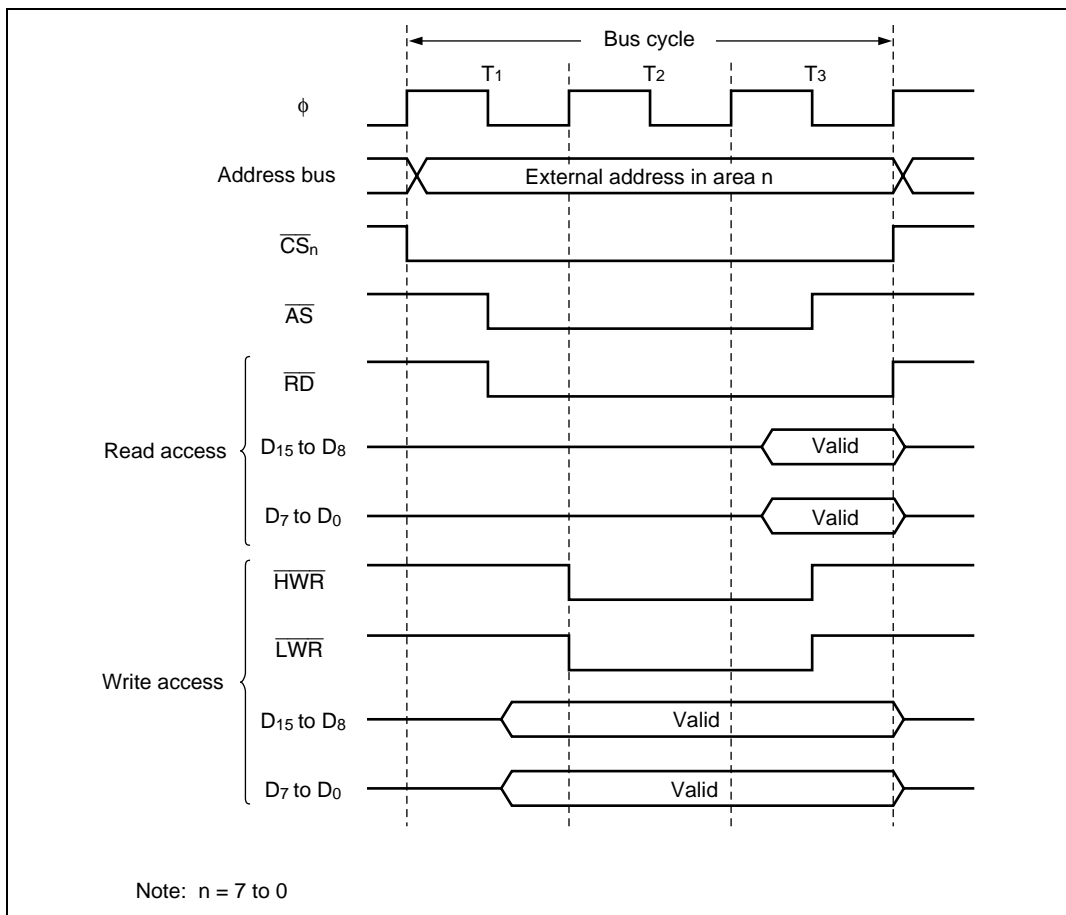

Figure 6.11 Bus Control Signal Timing for 16-Bit, Three-State-Access Area (1)
(Byte Access to Even Address)

**Figure 6.12 Bus Control Signal Timing for 16-Bit, Three-State-Access Area (2)
(Byte Access to Odd Address)**

**Figure 6.13 Bus Control Signal Timing for 16-Bit, Three-State-Access Area (3)
(Word Access)**

16-Bit, Two-State-Access Areas: Figures 6.14 to 6.16 show the timing of bus control signals for a 16-bit, two-state-access area. In these areas, the upper data bus (D_{15} to D_8) is used in accesses to even addresses and the lower data bus (D_7 to D_0) in accesses to odd addresses. Wait states cannot be inserted.

**Figure 6.15 Bus Control Signal Timing for 16-Bit, Two-State-Access Area (2)
(Byte Access to Odd Address)**

**Figure 6.16 Bus Control Signal Timing for 16-Bit, Two-State-Access Area (3)
(Word Access)**

6.4.6 Wait Control

When accessing external space, the H8/3062 Group can extend the bus cycle by inserting wait states (T_w). There are two ways of inserting wait states: program wait insertion and pin wait insertion using the \overline{WAIT} pin.

Program Wait Insertion: From 0 to 3 wait states can be inserted automatically between the T_2 state and T_3 state on an individual area basis in three-state access space, according to the settings of $WCRH$ and $WCRL$.

Pin Wait Insertion: Setting the WAITE bit in BCR to 1 enables wait insertion by means of the $\overline{\text{WAIT}}$ pin. When external space is accessed in this state, a program wait is first inserted. If the $\overline{\text{WAIT}}$ pin is low at the falling edge of ϕ in the last T_2 or T_W state, another T_W state is inserted. If the $\overline{\text{WAIT}}$ pin is held low, T_W states are inserted until it goes high.

This is useful when inserting four or more T_W states, or when changing the number of T_W states for different external devices.

The WAITE bit setting applies to all areas.

Figure 6.17 shows an example of the timing for insertion of one program wait state in 3-state space.

Figure 6.17 Example of Wait State Insertion Timing

6.5 Idle Cycle

6.5.1 Operation

When the H8/3062 Group chip accesses external space, it can insert a 1-state idle cycle (T_i) between bus cycles in the following cases: when read accesses between different areas occur consecutively, and when a write cycle occurs immediately after a read cycle. By inserting an idle cycle it is possible, for example, to avoid data collisions between ROM, which has a long output floating time, and high-speed memory, I/O interfaces, and so on.

The initial value of the ICIS1 and ICIS0 bits in BCR is 1, so that idle cycle insertion is performed in the initial state. If there are no data collisions, the ICIS bits can be cleared.

Consecutive Reads between Different Areas: If consecutive reads between different areas occur while the ICIS1 bit is set to 1 in BCR, an idle cycle is inserted at the start of the second read cycle.

Figure 6.18 shows an example of the operation in this case. In this example, bus cycle A is a read cycle from ROM with a long output floating time, and bus cycle B is a read cycle from SRAM, each being located in a different area. In (a), an idle cycle is not inserted, and a collision occurs in bus cycle B between the read data from ROM and that from SRAM. In (b), an idle cycle is inserted, and a data collision is prevented.

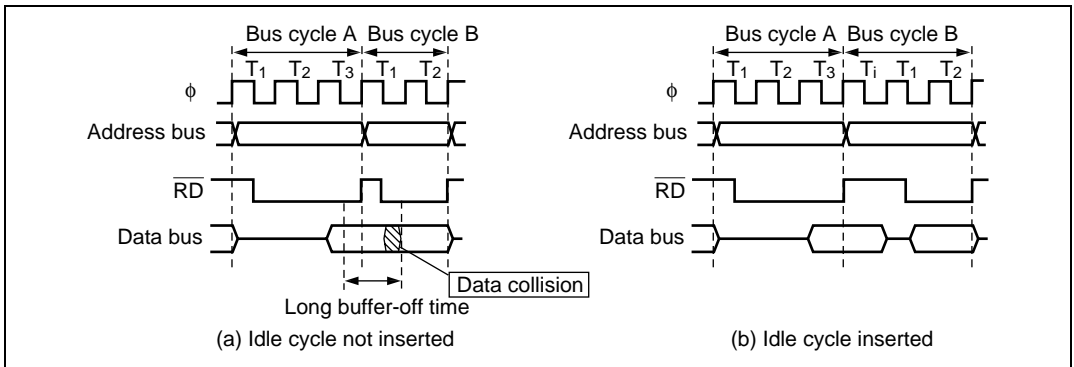

Figure 6.18 Example of Idle Cycle Operation (ICIS1 = 1)

Write after Read: If an external write occurs after an external read while the ICIS0 bit is set to 1 in BCR, an idle cycle is inserted at the start of the write cycle.

Figure 6.19 shows an example of the operation in this case. In this example, bus cycle A is a read cycle from ROM with a long output floating time, and bus cycle B is a CPU write cycle.

In (a), an idle cycle is not inserted, and a collision occurs in bus cycle B between the read data from ROM and the CPU write data. In (b), an idle cycle is inserted, and a data collision is prevented.

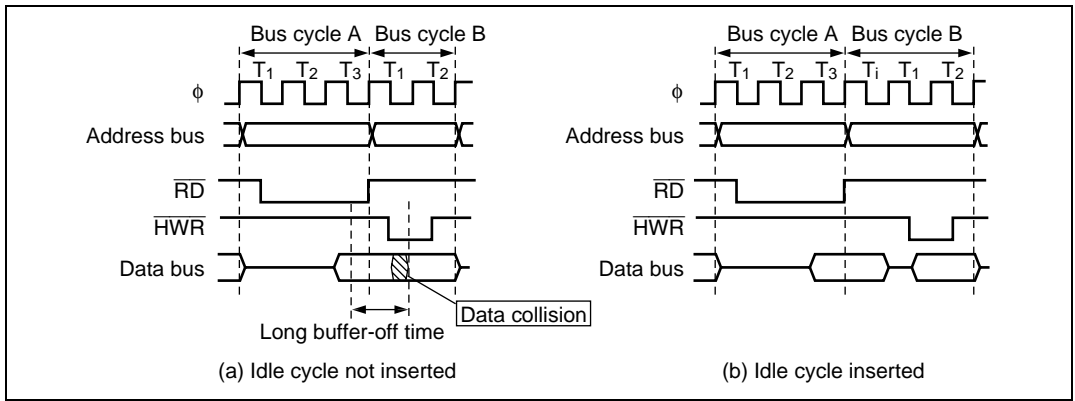

Figure 6.19 Example of Idle Cycle Operation (ICIS0 = 1)

Usage Note: When non-insertion of an idle cycle is specified, the rise (negation) of \overline{RD} and fall (assertion) of \overline{CS}_n may occur simultaneously. Figure 6.20 shows an example of the operation in this case.

If consecutive reads to a different external area occur while the ICIS1 bit in BCR is cleared to 0, or if an external read is followed by a write cycle for a different external area while the ICIS0 bit is cleared to 0, negation of \overline{RD} in the first read cycle and assertion of \overline{CS}_n in the following bus cycle will occur simultaneously. Depending on the output delay time of each signal, therefore, it is possible that the \overline{RD} low output in the previous read cycle and the \overline{CS}_n low output in the following bus cycle will overlap.

As long as \overline{RD} and \overline{CS}_n do not change simultaneously, or if there is no problem even if they do, non-insertion of an idle cycle can be specified.

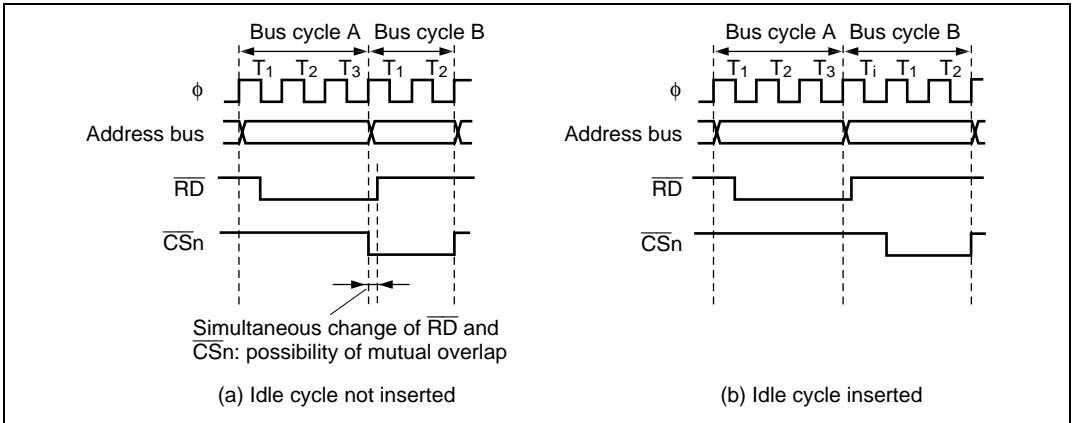

Figure 6.20 Example of Idle Cycle Operation

6.5.2 Pin States in Idle Cycle

Table 6.5 shows the pin states in an idle cycle.

Table 6.5 Pin States in Idle Cycle

Pins	Pin State
A_{23} to A_0	Next cycle address value
D_{15} to D_0	High impedance
\overline{CSn}	High
\overline{AS}	High
\overline{RD}	High
\overline{HWR}	High
\overline{LWR}	High

6.6 Bus Arbiter

The bus controller has a built-in bus arbiter that arbitrates between different bus masters. The bus master can be either the CPU or an external bus master. When a bus master has the bus right it can carry out read and write operations. Each bus master uses a bus request signal to request the bus right. At fixed times the bus arbiter determines priority and uses a bus acknowledge signal to grant the bus to a bus master, which can then operate using the bus.

The bus arbiter checks whether the bus request signal from a bus master is active or inactive, and returns an acknowledge signal to the bus master. When two or more bus masters request the bus, the highest-priority bus master receives an acknowledge signal. The bus master that receives an acknowledge signal can continue to use the bus until the acknowledge signal is deactivated.

The bus master priority order is:

(High) External bus master > CPU (Low)

The bus arbiter samples the bus request signals and determines priority at all times, but it does not always grant the bus immediately, even when it receives a bus request from a bus master with higher priority than the current bus master. Each bus master has certain times at which it can release the bus to a higher-priority bus master.

6.6.1 Operation

CPU: The CPU is the lowest-priority bus master. If an external bus master requests the bus while the CPU has the bus right, the bus arbiter transfers the bus right to the bus master that requested it. The bus right is transferred at the following times:

- The bus right is transferred at the boundary of a bus cycle. If word data is accessed by two consecutive byte accesses, however, the bus right is not transferred between the two byte accesses.
- If another bus master requests the bus while the CPU is performing internal operations, such as executing a multiply or divide instruction, the bus right is transferred immediately. The CPU continues its internal operations.
- If another bus master requests the bus while the CPU is in sleep mode, the bus right is transferred immediately.

External Bus Master: When the BRLE bit is set to 1 in BRCR, the bus can be released to an external bus master. The external bus master has highest priority, and requests the bus right from the bus arbiter driving the $\overline{\text{BREQ}}$ signal low. Once the external bus master acquires the bus, it keeps the bus until the $\overline{\text{BREQ}}$ signal goes high. While the bus is released to an external bus master, the H8/3062 Group chip holds the address bus, data bus, bus control signals ($\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{HWR}}$, and $\overline{\text{LWR}}$), and chip select signals ($\overline{\text{CSn}}$: n = 7 to 0) in the high-impedance state, and holds the $\overline{\text{BACK}}$ pin in the low output state.

The bus arbiter samples the $\overline{\text{BREQ}}$ pin at the rise of the system clock (ϕ). If $\overline{\text{BREQ}}$ is low, the bus is released to the external bus master at the appropriate opportunity. The $\overline{\text{BREQ}}$ signal should be held low until the $\overline{\text{BACK}}$ signal goes low.

When the $\overline{\text{BREQ}}$ pin is high in two consecutive samples, the $\overline{\text{BACK}}$ pin is driven high to end the bus-release cycle.

Figure 6.21 shows the timing when the bus right is requested by an external bus master during a read cycle in a two-state access area. There is a minimum interval of three states from when the $\overline{\text{BREQ}}$ goes low until the bus is released.

Figure 6.21 Example of External Bus Master Operation

When making a transition to software standby mode, if there is contention with a bus request from an external bus master, the $\overline{\text{BACK}}$ and strobe states may be indefinite when the transition is made.

When using software standby mode, clear the BRLE bit to 0 in BRCR before executing the SLEEP instruction.

6.7 Register and Pin Input Timing

6.7.1 Register Write Timing

ABWCR, ASTCR, WCRH, and WCRL Write Timing: Data written to ABWCR, ASTCR, WCRH, and WCRL takes effect starting from the next bus cycle. Figure 6.22 shows the timing when an instruction fetched from area 0 changes area 0 from three-state access to two-state access.

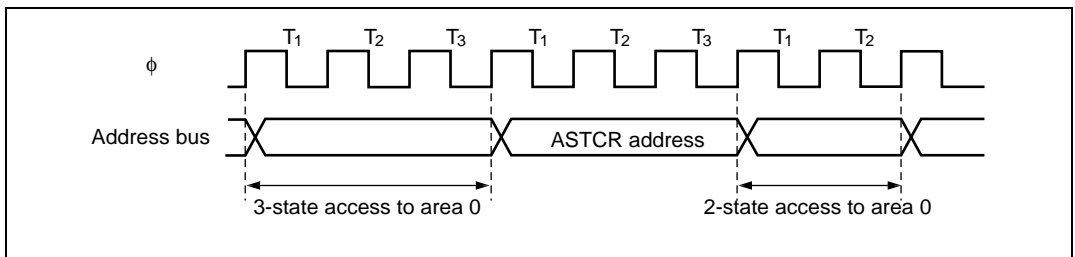

Figure 6.22 ASTCR Write Timing

DDR and CSCR Write Timing: Data written to DDR or CSCR for the port corresponding to the $\overline{\text{CS}}_n$ pin to switch between $\overline{\text{CS}}_n$ output and generic input takes effect starting from the T_3 state of the DDR write cycle. Figure 6.23 shows the timing when the $\overline{\text{CS}}_1$ pin is changed from generic input to $\overline{\text{CS}}_1$ output.

Figure 6.23 DDR Write Timing

BRCR Write Timing: Data written to BRCR to switch between A_{23} , A_{22} , A_{21} , or A_{20} output and generic input or output takes effect starting from the T_3 state of the BRCR write cycle. Figure 6.24 shows the timing when a pin is changed from generic input to A_{23} , A_{22} , A_{21} , or A_{20} output.

Figure 6.24 BRCR Write Timing

6.7.2 \overline{BREQ} Pin Input Timing

After driving the \overline{BREQ} pin low, hold it low until \overline{BACK} goes low. If \overline{BREQ} returns to the high level before \overline{BACK} goes low, the bus arbiter may operate incorrectly.

To terminate the external-bus-released state, hold the \overline{BREQ} signal high for at least three states. If \overline{BREQ} is high for too short an interval, the bus arbiter may operate incorrectly.

Section 7 I/O Ports

7.1 Overview

The H8/3062 Group has 10 input/output ports (ports 1, 2, 3, 4, 5, 6, 8, 9, A, and B) and one input-only port (port 7). Table 7.1 summarizes the port functions. The pins in each port are multiplexed as shown in table 7.1.

Each port has a data direction register (DDR) for selecting input or output, and a data register (DR) for storing output data. In addition to these registers, ports 2, 4, and 5 have an input pull-up control register (PCR) for switching input pull-up transistors on and off.

Ports 1 to 6 and port 8 can drive one TTL load and a 90-pF capacitive load. Ports 9, A, and B can drive one TTL load and a 30-pF capacitive load. Ports 1 to 6 and 8 to B can drive a darlington pair. Ports 1, 2, and 5 can drive LEDs (with 10-mA current sink). Pins P8₂ to P8₀, PA₇ to PA₀ have Schmitt-trigger input circuits.

For block diagrams of the ports see appendix C, I/O Port Block Diagrams.

7.2 Port 1

7.2.1 Overview

Port 1 is an 8-bit input/output port also used for address output, with the pin configuration shown in figure 7.1. The pin functions differ according to the operating mode. In modes 1 to 4 (expanded modes with on-chip ROM disabled), they are address bus output pins (A_7 to A_0).

In mode 5 (expanded modes with on-chip ROM enabled), settings in the port 1 data direction register (P1DDR) can designate pins for address bus output (A_7 to A_0) or generic input. In modes 6 and 7 (single-chip mode), port 1 is a generic input/output port.

Pins in port 1 can drive one TTL load and a 90-pF capacitive load. They can also drive an LED or a darlington transistor pair.

Figure 7.1 Port 1 Pin Configuration

7.2.2 Register Descriptions

Table 7.2 summarizes the registers of port 1.

Table 7.2 Port 1 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Modes 1 to 4	Modes 5 to 7
H'EE00	Port 1 data direction register	P1DDR	W	H'FF	H'00
H'FFFD0	Port 1 data register	P1DR	R/W	H'00	H'00

Note: * Lower 20 bits of the address in advanced mode

Port 1 Data Direction Register (P1DDR): P1DDR is an 8-bit write-only register that can select input or output for each pin in port 1.

Bit								
	7	6	5	4	3	2	1	0
	P1 ₇ DDR	P1 ₆ DDR	P1 ₅ DDR	P1 ₄ DDR	P1 ₃ DDR	P1 ₂ DDR	P1 ₁ DDR	P1 ₀ DDR
Modes 1 to 4	Initial value	1	1	1	1	1	1	1
	Read/Write	—	—	—	—	—	—	—
Modes 5 to 7	Initial value	0	0	0	0	0	0	0
	Read/Write	W	W	W	W	W	W	W

Port 1 data direction 7 to 0

These bits select input or output for port 1 pins

- Modes 1 to 4 (Expanded Modes with On-Chip ROM Disabled)
P1DDR values are fixed at 1. Port 1 functions as an address bus.
- Mode 5 (Expanded Modes with On-Chip ROM Enabled)
After a reset, port 1 functions as an input port. A pin in port 1 becomes an address output pin if the corresponding P1DDR bit is set to 1, and a generic input pin if this bit is cleared to 0.
- Modes 6 and 7 (Single-Chip Mode)
Port 1 functions as an input/output port. A pin in port 1 becomes an output port if the corresponding P1DDR bit is set to 1, and an input port if this bit is cleared to 0.

In modes 1 to 4, P1DDR bits are always read as 1, and cannot be modified.

In modes 5 to 7, P1DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P1DDR is initialized to H'FF in modes 1 to 4, and to H'00 in modes 5 to 7, by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port 1 is functioning as an input/output port and a P1DDR bit is set to 1, the corresponding pin maintains its output state.

Port 1 Data Register (P1DR): P1DR is an 8-bit readable/writable register that stores port 1 output data. When port 1 functions as an output port, the value of this register is output. When this register is read, the pin logic level is read for bits for which the P1DDR setting is 0, and the P1DR value is read for bits for which the P1DDR setting is 1.

Bit	7	6	5	4	3	2	1	0
	P1 ₇	P1 ₆	P1 ₅	P1 ₄	P1 ₃	P1 ₂	P1 ₁	P1 ₀
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 1 data 7 to 0

These bits store data for port 1 pins

P1DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.3 Port 2

7.3.1 Overview

Port 2 is an 8-bit input/output port which also has an address output function. It's pin configuration is shown in figure 7.2. The pin functions differ according to the operating mode.

In modes 1 to 4 (expanded modes with on-chip ROM disabled), port 2 consists of address bus output pins (A_{15} to A_8). In mode 5 (expanded modes with on-chip ROM enabled), settings in the port 2 data direction register (P2DDR) can designate pins for address bus output (A_{15} to A_8) or generic input. In modes 6 and 7 (single-chip mode), port 2 is a generic input/output port.

Port 2 has software-programmable built-in pull-up transistors.

Pins in port 2 can drive one TTL load and a 90-pF capacitive load. They can also drive an LED or a darlington transistor pair.

	Port 2 pins	Modes 1 to 4	Mode 5	Modes 6 and 7
	P2 ₇ /A ₁₅	A ₁₅ (output)	P2 ₇ (input)/A ₁₅ (output)	P2 ₇ (input/output)
	P2 ₆ /A ₁₄	A ₁₄ (output)	P2 ₆ (input)/A ₁₄ (output)	P2 ₆ (input/output)
	P2 ₅ /A ₁₃	A ₁₃ (output)	P2 ₅ (input)/A ₁₃ (output)	P2 ₅ (input/output)
	P2 ₄ /A ₁₂	A ₁₂ (output)	P2 ₄ (input)/A ₁₂ (output)	P2 ₄ (input/output)
	P2 ₃ /A ₁₁	A ₁₁ (output)	P2 ₃ (input)/A ₁₁ (output)	P2 ₃ (input/output)
	P2 ₂ /A ₁₀	A ₁₀ (output)	P2 ₂ (input)/A ₁₀ (output)	P2 ₂ (input/output)
	P2 ₁ /A ₉	A ₉ (output)	P2 ₁ (input)/A ₉ (output)	P2 ₁ (input/output)
	P2 ₀ /A ₈	A ₈ (output)	P2 ₀ (input)/A ₈ (output)	P2 ₀ (input/output)

7.3.2 Register Descriptions

Table 7.3 summarizes the registers of port 2.

Table 7.3 Port 2 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Modes 1 to 4	Modes 5 to 7
H'EE001	Port 2 data direction register	P2DDR	W	H'FF	H'00
H'FFFD1	Port 2 data register	P2DR	R/W	H'00	H'00
H'EE03C	Port 2 input pull-up MOS control register	P2PCR	R/W	H'00	H'00

Note: * Lower 20 bits of the address in advanced mode

Port 2 Data Direction Register (P2DDR): P2DDR is an 8-bit write-only register that can select input or output for each pin in port 2.

Bit		7	6	5	4	3	2	1	0
		P2 ₇ DDR	P2 ₆ DDR	P2 ₅ DDR	P2 ₄ DDR	P2 ₃ DDR	P2 ₂ DDR	P2 ₁ DDR	P2 ₀ DDR
Modes 1 to 4	Initial value	1	1	1	1	1	1	1	1
	Read/Write	—	—	—	—	—	—	—	—
Modes 5 to 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	W	W	W	W	W	W	W	W

Port 2 data direction 7 to 0

These bits select input or output for port 2 pins

- Modes 1 to 4 (Expanded Modes with On-Chip ROM Disabled)
P2DDR values are fixed at 1. Port 2 functions as an address bus.
- Mode 5 (Expanded Modes with On-Chip ROM Enabled)
Following a reset, port 2 is an input port. A pin in port 2 becomes an address output pin if the corresponding P2DDR bit is set to 1, and a generic input port if this bit is cleared to 0.
- Modes 6 and 7 (Single-Chip Mode)
Port 2 functions as an input/output port. A pin in port 2 becomes an output port if the corresponding P2DDR bit is set to 1, and an input port if this bit is cleared to 0.

In modes 1 to 4, P2DDR bits are always read as 1, and cannot be modified.

In modes 5 to 7, P2DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P2DDR is initialized to H'FF in modes 1 to 4, and to H'00 in modes 5 to 7, by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port 2 is functioning as an input/output port and a P2DDR bit is set to 1, the corresponding pin maintains its output state.

Port 2 Data Register (P2DR): P2DR is an 8-bit readable/writable register that stores output data for Port 2. When port 2 functions as an output port, the value of this register is output. When a bit in P2DDR is set to 1, if port 2 is read the value of the corresponding P2DR bit is returned. When a bit in P2DDR is cleared to 0, if port 2 is read the corresponding pin logic level is read.

Bit	7	6	5	4	3	2	1	0
	P2 ₇	P2 ₆	P2 ₅	P2 ₄	P2 ₃	P2 ₂	P2 ₁	P2 ₀

Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 2 input pull-up MOS control 7 to 0

These bits control input pull-up transistors built into port 2

In modes 5 to 7, when a P2DDR bit is cleared to 0 (selecting generic input), if the corresponding bit in P2PCR is set to 1, the input pull-up transistor is turned on.

P2PCR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 7.4 summarizes the states of the input pull-ups in each mode.

Table 7.4 Input Pull-Up Transistor States (Port 2)

Mode	Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1	Off	Off	Off	Off
2				
3				
4				
5	Off	Off	On/off	On/off
6				
7				

Legend:

Off : The input pull-up transistor is always off.

On/off : The input pull-up transistor is on if P2PCR = 1 and P2DDR = 0. Otherwise, it is off.

7.4 Port 3

7.4.1 Overview

Port 3 is an 8-bit input/output port which also functions as a data bus. It's pin configuration is shown in figure 7.3. Port 3 is a data bus in modes 1 to 5 (expanded modes) and a generic input/output port in modes 6 and 7 (single-chip mode).

Pins in port 3 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

Figure 7.3 Port 3 Pin Configuration

7.4.2 Register Descriptions

Table 7.5 summarizes the registers of port 3.

Table 7.5 Port 3 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'EE002	Port 3 data direction register	P3DDR	W	H'00
H'FFFD2	Port 3 data register	P3DR	R/W	H'00

Note: * Lower 20 bits of the address in advanced mode

Port 3 Data Direction Register (P3DDR): P3DDR is an 8-bit write-only register that can select input or output for each pin in port 3.

Bit	7	6	5	4	3	2	1	0
	P3 ₇ DDR	P3 ₆ DDR	P3 ₅ DDR	P3 ₄ DDR	P3 ₃ DDR	P3 ₂ DDR	P3 ₁ DDR	P3 ₀ DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 3 data direction 7 to 0

These bits select input or output for port 3 pins

- Modes 1 to 5 (Expanded Modes)
Port 3 functions as a data bus, regardless of the P3DDR settings.
- Modes 6 and 7 (Single-Chip Mode)
Port 3 functions as an input/output port. A pin in port 3 becomes an output port if the corresponding P3DDR bit is set to 1, and an input port if this bit is cleared to 0.

P3DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P3DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port 3 is functioning as an input/output port and a P3DDR bit is set to 1, the corresponding pin maintains its output state.

Port 3 Data Register (P3DR): P3DR is an 8-bit readable/writable register that stores output data for port 3. When port 3 functions as an output port, the value of this register is output. When a bit in P3DDR is set to 1, if port 3 is read the value of the corresponding P3DR bit is returned. When a bit in P3DDR is cleared to 0, if port 3 is read the corresponding pin logic level is read.

Bit	7	6	5	4	3	2	1	0
	P3 ₇	P3 ₆	P3 ₅	P3 ₄	P3 ₃	P3 ₂	P3 ₁	P3 ₀
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 3 data 7 to 0

These bits store data for port 3 pins

P3DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.5 Port 4

7.5.1 Overview

Port 4 is an 8-bit input/output port which also functions as a data bus. It's pin configuration is shown in figure 7.4. The pin functions differ depending on the operating mode.

In modes 1 to 5 (expanded modes), when the bus width control register (ABWCR) designates areas 0 to 7 all as 8-bit-access areas, the chip operates in 8-bit bus mode and port 4 is a generic input/output port. When at least one of areas 0 to 7 is designated as a 16-bit-access area, the chip operates in 16-bit bus mode and port 4 becomes part of the data bus. In modes 6 and 7 (single-chip mode), port 4 is a generic input/output port.

Port 4 has software-programmable built-in pull-up transistors.

Pins in port 4 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

Figure 7.4 Port 4 Pin Configuration

7.5.2 Register Descriptions

Table 7.6 summarizes the registers of port 4.

Table 7.6 Port 4 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'EE003	Port 4 data direction register	P4DDR	W	H'00
H'FFFD3	Port 4 data register	P4DR	R/W	H'00
H'EE03E	Port 4 input pull-up MOS control register	P4PCR	R/W	H'00

Note: * Lower 20 bits of the address in advanced mode

Port 4 Data Direction Register (P4DDR): P4DDR is an 8-bit write-only register that can select input or output for each pin in port 4.

Bit	7	6	5	4	3	2	1	0
	P4 ₇ DDR	P4 ₆ DDR	P4 ₅ DDR	P4 ₄ DDR	P4 ₃ DDR	P4 ₂ DDR	P4 ₁ DDR	P4 ₀ DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 4 data direction 7 to 0

These bits select input or output for port 4 pins

- Modes 1 to 5 (Expanded Modes)

When all areas are designated as 8-bit-access areas by the bus controller's bus width control register (ABWCR), selecting 8-bit bus mode, port 4 functions as an input/output port. In this case, a pin in port 4 becomes an output port if the corresponding P4DDR bit is set to 1, and an input port if this bit is cleared to 0.

When at least one area is designated as a 16-bit-access area, selecting 16-bit bus mode, port 4 functions as part of the data bus, regardless of the P4DDR settings.

- Modes 6 and 7 (Single-Chip Mode)

Port 4 functions as an input/output port. A pin in port 4 becomes an output port if the corresponding P4DDR bit is set to 1, and an input port if this bit is cleared to 0.

P4DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P4DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

ABWCR and P4DDR are not initialized in software standby mode. Therefore, if a transition is made to software standby mode while port 4 is functioning as an input/output port and a P4DDR bit is set to 1, the corresponding pin maintains its output state.

Port 4 Data Register (P4DR): P4DR is an 8-bit readable/writable register that stores output data for port 4. When port 4 functions as an output port, the value of this register is output. When a bit in P4DDR is set to 1, if port 4 is read the value of the corresponding P4DR bit is returned. When a bit in P4DDR is cleared to 0, if port 4 is read the corresponding pin logic level is read.

Bit	7	6	5	4	3	2	1	0

Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 4 data 7 to 0

These bits store data for port 4 pins

P4DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 4 Input Pull-Up MOS Control Register (P4PCR): P4PCR is an 8-bit readable/writable register that controls the MOS input pull-up transistors in port 4.

Bit	7	6	5	4	3	2	1	0
	P4 ₇ PCR	P4 ₆ PCR	P4 ₅ PCR	P4 ₄ PCR	P4 ₃ PCR	P4 ₂ PCR	P4 ₁ PCR	P4 ₀ PCR
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 4 input pull-up MOS control 7 to 0

These bits control input pull-up transistors built into port 4

In modes 6 and 7 (single-chip mode), and in 8-bit bus mode in modes 1 to 5 (expanded modes), when a P4DDR bit is cleared to 0 (selecting generic input), if the corresponding P4PCR bit is set to 1, the input pull-up transistor is turned on.

P4PCR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 7.7 summarizes the states of the input pull-up MOS in each operating mode.

Table 7.7 Input Pull-Up Transistor States (Port 4)

Mode		Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1 to 5	8-bit bus mode	Off	Off	On/off	On/off
	16-bit bus mode			Off	Off
6 and 7				On/off	On/off

Legend:

Off : The input pull-up transistor is always off.

On/off : The input pull-up transistor is on if P4PCR = 1 and P4DDR = 0. Otherwise, it is off.

7.6 Port 5

7.6.1 Overview

Port 5 is a 4-bit input/output port which also has an address output function. Its pin configuration is shown in figure 7.5. The pin functions differ depending on the operating mode.

In modes 1 to 4 (expanded modes with on-chip ROM disabled), port 5 consists of address output pins (A_{19} to A_{16}). In mode 5 (expanded modes with on-chip ROM enabled), settings in the port 5 data direction register (P5DDR) designate pins for address bus output (A_{19} to A_{16}) or generic input. In modes 6 and 7 (single-chip mode), port 5 is a generic input/output port.

Port 5 has software-programmable built-in pull-up transistors.

Pins in port 5 can drive one TTL load and a 90-pF capacitive load. They can also drive an LED or a darlington transistor pair.

Figure 7.5 Port 5 Pin Configuration

7.6.2 Register Descriptions

Table 7.8 summarizes the registers of port 5.

Table 7.8 Port 5 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Modes 1 to 4	Modes 5 to 7
H'EE004	Port 5 data direction register	P5DDR	W	H'FF	H'F0
H'FFFD4	Port 5 data register	P5DR	R/W	H'F0	H'F0
H'EE03F	Port 5 input pull-up MOS control register	P5PCR	R/W	H'F0	H'F0

Note: * Lower 20 bits of the address in advanced mode

Port 5 Data Direction Register (P5DDR): P5DDR is an 8-bit write-only register that can select input or output for each pin in port 5.

Bits 7 to 4 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	P5 ₃ DDR	P5 ₂ DDR	P5 ₁ DDR	P5 ₀ DDR
Modes 1 to 4	Initial value	1	1	1	1	1	1	1
	Read/Write	—	—	—	—	—	—	—
Modes 5 to 7	Initial value	1	1	1	0	0	0	0
	Read/Write	—	—	—	W	W	W	W

Reserved bits
Port 5 data direction 3 to 0
These bits select input or output for port 5 pins

- Modes 1 to 4 (Expanded Modes with On-Chip ROM Disabled)
P5DDR values are fixed at 1. Port 5 functions as an address bus output.
- Mode 5 (Expanded Modes with On-Chip ROM Enabled)
Following a reset, port 5 is an input port. A pin in port 5 becomes an address output pin if the corresponding P5DDR bit is set to 1, and an input port if this bit is cleared to 0.
- Modes 6 and 7 (Single-Chip Mode)
Port 5 functions as an input/output port. A pin in port 5 becomes an output port if the corresponding P5DDR bit is set to 1, and an input port if this bit is cleared to 0.

In modes 1 to 4, P5DDR bits are always read as 1, and cannot be modified.

In modes 5 to 7, P5DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P5DDR is initialized to H'FF in modes 1 to 4, and to H'F0 in modes 5 to 7, by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port 5 is functioning as an input/output port and a P5DDR bit is set to 1, the corresponding pin maintains its output state.

Port 5 Data Register (P5DR): P5DR is an 8-bit readable/writable register that stores output data for port 5. When port 5 functions as an output port, the value of this register is output. When a bit in P5DDR is set to 1, if port 5 is read the value of the corresponding P5DR bit is returned. When a bit in P5DDR is cleared to 0, if port 5 is read the corresponding pin logic level is read.

Bits 7 to 4 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0

Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits
Port 5 data 3 to 0
These bits store data
for port 5 pins

P5DR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 5 Input Pull-Up MOS Control Register (P5PCR): P5PCR is an 8-bit readable/writable register that controls the MOS input pull-up transistors in port 5.

Bits 7 to 4 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	P5 ₃ PCR	P5 ₂ PCR	P5 ₁ PCR	P5 ₀ PCR
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits
Port 5 input pull-up MOS control 3 to 0
 These bits control input pull-up transistors built into port 5

In modes 5 to 7, when a P5DDR bit is cleared to 0 (selecting generic input), if the corresponding bit in P5PCR is set to 1, the input pull-up transistor is turned on.

P5PCR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 7.9 summarizes the states of the input pull-ups in each mode.

Table 7.9 Input Pull-Up Transistor States (Port 5)

Mode	Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1	Off	Off	Off	Off
2				
3				
4				
5	Off	Off	On/off	On/off
6				
7				

Legend:

Off : The input pull-up transistor is always off.

On/off : The input pull-up transistor is on if P5PCR = 1 and P5DDR = 0. Otherwise, it is off.

7.7 Port 6

7.7.1 Overview

Port 6 is an 8-bit input/output port that is also used for input and output of bus control signals ($\overline{\text{LWR}}$, $\overline{\text{HWR}}$, $\overline{\text{RD}}$, $\overline{\text{AS}}$, $\overline{\text{BACK}}$, $\overline{\text{BREQ}}$, $\overline{\text{WAIT}}$) and for clock (ϕ) output.

The port 6 pin configuration is shown in figure 7.6.

See table 7.11 for the selection of the pin functions.

Pins in port 6 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

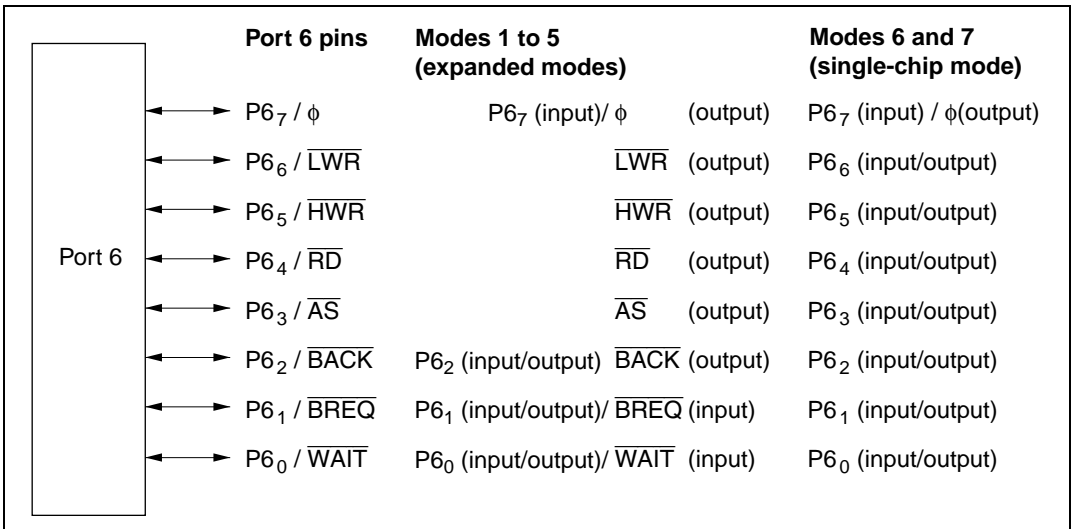

Figure 7.6 Port 6 Pin Configuration

7.7.2 Register Descriptions

Table 7.10 summarizes the registers of port 6.

Table 7.10 Port 6 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'EE005	Port 6 data direction register	P6DDR	W	H'80
H'FFFD5	Port 6 data register	P6DR	R/W	H'80

Note: * Lower 20 bits of the address in advanced mode

Port 6 Data Direction Register (P6DDR): P6DDR is an 8-bit write-only register that can select input or output for each pin in port 6.

Bit 7 is reserved. It is fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	P6 ₆ DDR	P6 ₅ DDR	P6 ₄ DDR	P6 ₃ DDR	P6 ₂ DDR	P6 ₁ DDR	P6 ₀ DDR
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	W	W	W	W	W	W	W

Reserved bit
Port 6 data direction 6 to 0
 These bits select input or output for port 6 pins

- Modes 1 to 5 (Expanded Modes)

P6₇ functions as the clock output pin (ϕ) or an input port. P6₇ is the clock output pin (ϕ) if the PSTOP bit in MSTRCH is cleared to 0 (initial value), and an input port if this bit is set to 1.

P6₆ to P6₃ function as bus control output pins ($\overline{\text{LWR}}$, $\overline{\text{HWR}}$, $\overline{\text{RD}}$, and $\overline{\text{AS}}$), regardless of the settings of bits P6₆DDR to P6₃DDR.

P6₂ to P6₀ function as bus control input/output pins ($\overline{\text{BACK}}$, $\overline{\text{BREQ}}$, and $\overline{\text{WAIT}}$) or input/output ports. For the method of selecting the pin functions, see table 7.11.

When P6₂ to P6₀ function as input/output ports, the pin becomes an output port if the corresponding P6DDR bit is set to 1, and an input port if this bit is cleared to 0.

- Modes 6 and 7 (Single-Chip Mode)

P6₇ functions as the clock output pin (ϕ) or an input port. P6₆ to P6₀ function as generic input/output ports. P6₇ is the clock output pin (ϕ) if the PSTOP bit in MSTCRH is cleared to 0 (initial value), and an input port if this bit is set to 1. A pin in port 6 becomes an output port if the corresponding bit of P6₆DDR to P6₀DDR is set to 1, and an input port if this pin is cleared to 0.

P6DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P6DDR is initialized to H'80 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port 6 is functioning as an input/output port and a P6DDR bit is set to 1, the corresponding pin maintains its output state.

Port 6 Data Register (P6DR): P6DR is an 8-bit readable/writable register that stores output data for port 6. When port 6 functions as an output port, the value of this register is output. For bit 7, a value of 1 is returned if the bit is read while the PSTOP bit in MSTCRH is cleared to 0, and the P6₇ pin logic level is returned if the bit is read while the PSTOP bit is set to 1. Bit 7 cannot be modified. For bits 6 to 0, the pin logic level is returned if the bit is read while the corresponding bit in P6DDR is cleared to 0, and the P6DR value is returned if the bit is read while the corresponding bit in P6DDR is set to 1.

Bit	7	6	5	4	3	2	1	0
	P6 ₇	P6 ₆	P6 ₅	P6 ₄	P6 ₃	P6 ₂	P6 ₁	P6 ₀
Initial value	1	0	0	0	0	0	0	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 6 data 7 to 0

These bits store data for port 6 pins

P6DR is initialized to H'80 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 7.11 Port 6 Pin Functions in Modes 1 to 5

Pin	Pin Functions and Selection Method			
$P6_7/\phi$	Bit PSTOP in MSTCRH selects the pin function.			
	PSTOP	0	1	
	Pin function	ϕ output	$P6_7$ input	
\overline{LWR}	Functions as \overline{LWR} regardless of the setting of bit $P6_6$ DDR.			
	$P6_6$ DDR	0	1	
	Pin function	\overline{LWR} output		
\overline{HWR}	Functions as \overline{HWR} regardless of the setting of bit $P6_5$ DDR.			
	$P6_5$ DDR	0	1	
	Pin function	\overline{HWR} output		
\overline{RD}	Functions as \overline{RD} regardless of the setting of bit $P6_4$ DDR.			
	$P6_4$ DDR	0	1	
	Pin function	\overline{RD} output		
\overline{AS}	Functions as \overline{AS} regardless of the setting of bit $P6_3$ DDR.			
	$P6_3$ DDR	0	1	
	Pin function	\overline{AS} output		
$P6_2/\overline{BACK}$	Bit BRLE in BRCCR and bit $P6_2$ DDR select the pin function as follows.			
	BRLE	0		1
	$P6_2$ DDR	0	1	—
	Pin function	$P6_2$ input	$P6_2$ output	\overline{BACK} output
$P6_1/\overline{BREQ}$	Bit BRLE in BRCCR and bit $P6_1$ DDR select the pin function as follows.			
	BRLE	0		1
	$P6_1$ DDR	0	1	—
	Pin function	$P6_1$ input	$P6_1$ output	\overline{BREQ} input

Pin Pin Functions and Selection Method

P6₀/WAITBit WAITE in BCR and bit P6₀DDR select the pin function as follows.

WAITE	0		1
P6 ₀ DDR	0	1	0*
Pin function	P6 ₀ input	P6 ₀ output	WAIT input

Note: * Do not set bit P6₀DDR to 1.

7.8 Port 7

7.8.1 Overview

Port 7 is an 8-bit input port that is also used for analog input to the A/D converter and analog output from the D/A converter. The pin functions are the same in all operating modes. Figure 7.7 shows the pin configuration of port 7.

See section 14, A/D Converter, for details of the A/D converter analog input pins, and section 15, D/A Converter, for details of the D/A converter analog output pins.

Figure 7.7 Port 7 Pin Configuration

7.8.2 Register Description

Table 7.12 summarizes the port 7 register. Port 7 is an input port, and port 7 has no data direction register.

Table 7.12 Port 7 Data Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFFD6	Port 7 data register	P7DR	R	Undetermined

Note: * Lower 20 bits of the address in advanced mode

Port 7 Data Register (P7DR)

Bit	7	6	5	4	3	2	1	0
	P7 ₇	P7 ₆	P7 ₅	P7 ₄	P7 ₃	P7 ₂	P7 ₁	P7 ₀
Initial value	—*	—*	—*	—*	—*	—*	—*	—*
Read/Write	R	R	R	R	R	R	R	R

Note: * Determined by pins P7₇ to P7₀.

When port 7 is read, the pin logic levels are always read. P7DR cannot be modified.

7.9 Port 8

7.9.1 Overview

Port 8 is a 5-bit input/output port that is also used for \overline{CS}_3 to \overline{CS}_0 output, \overline{IRQ}_3 to \overline{IRQ}_0 input, and A/D converter \overline{ADTRG} input. Figure 7.8 shows the pin configuration of port 8.

In modes 1 to 5 (expanded modes), port 8 can provide \overline{CS}_3 to \overline{CS}_0 output, \overline{IRQ}_3 to \overline{IRQ}_0 input, and \overline{ADTRG} input. See table 7.14 for the selection of pin functions in expanded modes.

In modes 6 and 7 (single-chip modes), port 8 can provide \overline{IRQ}_3 to \overline{IRQ}_0 input and \overline{ADTRG} input. See table 7.15 for the selection of pin functions in single-chip mode.

See section 14, A/D Converter, for a description of the A/D converter's \overline{ADTRG} input pin.

The \overline{IRQ}_3 to \overline{IRQ}_0 functions are selected by IER settings, regardless of whether the pin is used for input or output. Caution is therefore required. For details see section 5.3.1, External Interrupts.

Pins in port 8 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

Pins P8₂ to P8₀ have Schmitt-trigger inputs.

Figure 7.8 Port 8 Pin Configuration

7.9.2 Register Descriptions

Table 7.13 summarizes the registers of port 8.

Table 7.13 Port 8 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Mode 1 to 4	Mode 5 to 7
H'EE007	Port 8 data direction register	P8DDR	W	H'F0	H'E0
H'FFFD7	Port 8 data register	P8DR	R/W	H'E0	H'E0

Note: * Lower 20 bits of the address in advanced mode

Port 8 Data Direction Register (P8DDR): P8DDR is an 8-bit write-only register that can select input or output for each pin in port 8.

Bits 7 to 5 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	—	—	P8 ₄ DDR	P8 ₃ DDR	P8 ₂ DDR	P8 ₁ DDR	P8 ₀ DDR
Modes 1 to 4	Initial value	1	1	1	1	0	0	0
	Read/Write	—	—	—	W	W	W	W
Modes 5 to 7	Initial value	1	1	1	0	0	0	0
	Read/Write	—	—	—	W	W	W	W

Reserved bits
Port 8 data direction 4 to 0
 These bits select input or output for port 8 pins

- Modes 1 to 5 (Expanded Modes)

When bits in P8DDR bit are set to 1, P8₄ to P8₁ become \overline{CS}_0 to \overline{CS}_3 output pins. When bits in P8DDR are cleared to 0, the corresponding pins become input ports.

In modes 1 to 4 (expanded modes with on-chip ROM disabled), following a reset P8₄ functions as the \overline{CS}_0 output, while \overline{CS}_1 to \overline{CS}_3 are input ports. In mode 5 (expanded mode with on-chip ROM enabled), following a reset \overline{CS}_0 to \overline{CS}_3 are all input ports.

- Modes 6 and 7 (Single-Chip Mode)

Port 8 is a generic input/output port. A pin in port 8 becomes an output port if the corresponding P8DDR bit is set to 1, and an input port if this bit is cleared to 0.

P8DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P8DDR is initialized to H'F0 in modes 1 to 4, and to H'E0 in modes 5 to 7, by a reset and in hardware standby mode. In software standby mode P8DDR retains its previous setting. Therefore, if a transition is made to software standby mode while port 8 is functioning as an input/output port and a P8DDR bit is set to 1, the corresponding pin maintains its output state.

Port 8 Data Register (P8DR): P8DR is an 8-bit readable/writable register that stores output data for port 8. When port 8 functions as an output port, the value of this register is output. When a bit in P8DDR is set to 1, if port 8 is read the value of the corresponding P8DR bit is returned. When a bit in P8DDR is cleared to 0, if port 8 is read the corresponding pin logic level is read.

Bits 7 to 5 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	—	—	P8 ₄	P8 ₃	P8 ₂	P8 ₁	P8 ₀
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits
Port 8 data 4 to 0
These bits store data
for port 8 pins

P8DR is initialized to H'E0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

P8 ₀ / $\overline{\text{IRQ}}_0$	Bit P8 ₀ DDR select the pin function as follows.		
	P8 ₀ DDR	0	1
	Pin function	P8 ₀ input	P8 ₀ output
		$\overline{\text{IRQ}}_0$ input	

7.10 Port 9

7.10.1 Overview

Port 9 is a 6-bit input/output port that is also used for input and output (TxD₀, TxD₁, RxD₀, RxD₁, SCK₀, SCK₁) by serial communication interface channels 0 and 1 (SCI0 and SCI1), and for $\overline{\text{IRQ}}_5$ and $\overline{\text{IRQ}}_4$ input. See table 7.17 for the selection of pin functions.

The $\overline{\text{IRQ}}_5$ and $\overline{\text{IRQ}}_4$ functions are selected by IER settings, regardless of whether the pin is used for input or output. Caution is therefore required. For details see section 5.3.1, External Interrupts.

Port 9 has the same set of pin functions in all operating modes. Figure 7.9 shows the pin configuration of port 9.

Pins in port 9 can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair.

Figure 7.9 Port 9 Pin Configuration

7.10.2 Register Descriptions

Table 7.16 summarizes the registers of port 9.

Table 7.16 Port 9 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'EE008	Port 9 data direction register	P9DDR	W	H'C0
H'FFFD8	Port 9 data register	P9DR	R/W	H'C0

Note: * Lower 20 bits of the address in advanced mode

Port 9 Data Direction Register (P9DDR): P9DDR is an 8-bit write-only register that can select input or output for each pin in port 9.

Bits 7 and 6 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	—	P9 ₅ DDR	P9 ₄ DDR	P9 ₃ DDR	P9 ₂ DDR	P9 ₁ DDR	P9 ₀ DDR
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	W	W	W	W	W	W

Reserved bits
Port 9 data direction 5 to 0
These bits select input or output for port 9 pins

When port 9 functions as an input/output port, a pin in port 9 becomes an output port if the corresponding P9DDR bit is set to 1, and an input port if this bit is cleared to 0. For the method of selecting the pin functions, see table 7.17.

P9DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P9DDR is initialized to H'C0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port 9 is functioning as an input/output port and a P9DDR bit is set to 1, the corresponding pin maintains its output state.

Port 9 Data Register (P9DR): P9DR is an 8-bit readable/writable register that stores output data for port 9. When port 9 functions as an output port, the value of this register is output. When a bit in P9DDR is set to 1, if port 9 is read the value of the corresponding P9DR bit is returned. When a bit in P9DDR is cleared to 0, if port 9 is read the corresponding pin logic level is read.

Bits 7 and 6 are reserved. They are fixed at 1, and cannot be modified.

Bit	7	6	5	4	3	2	1	0
	—	—	P9 ₅	P9 ₄	P9 ₃	P9 ₂	P9 ₁	P9 ₀
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits
Port 9 data 5 to 0
These bits store data
for port 9 pins

P9DR is initialized to H'C0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 7.17 Port 9 Pin Functions

Pin	Pin Functions and Selection Method				
$P9_5/SCK_1/\overline{IRQ}_5$	Bit C/\overline{A} in SMR of SCI1, bits CKE0 and CKE1 in SCR, and bit P9 ₅ DDR select the pin function as follows.				
CKE1	0				1
C/\overline{A}	0			1	—
CKE0	0		1	—	—
P9 ₅ DDR	0	1	—	—	—
Pin function	P9 ₅ input	P9 ₅ output	SCK ₁ output	SCK ₁ output	SCK ₁ input
	\overline{IRQ}_5 input				

$P9_4/SCK_0/\overline{IRQ}_4$	Bit C/\overline{A} in SMR of SCI0, bits CKE0 and CKE1 in SCR, and bit P9 ₄ DDR select the pin function as follows.				
CKE1	0				1
C/\overline{A}	0			1	—
CKE0	0		1	—	—
P9 ₄ DDR	0	1	—	—	—
Pin function	P9 ₄ input	P9 ₄ output	SCK ₀ output	SCK ₀ output	SCK ₀ input
	\overline{IRQ}_4 input				

$P9_3/RxD_1$	Bit RE in SCR of SCI1, bit SMIF in SCMR, and bit P9 ₃ DDR select the pin function as follows.				
SMIF	0				1
RE	0		1	—	
P9 ₃ DDR	0	1	—		—
Pin function	P9 ₃ input	P9 ₃ output	RxD ₁ input	RxD ₁ input	

Pin Pin Functions and Selection Method

P9₂/RxD₀

Bit RE in SCR of SCI0, bit SMIF in SCMR, and bit P9₂DDR select the pin function as follows.

SMIF	0			1
RE	0		1	—
P9 ₂ DDR	0	1	—	—
Pin function	P9 ₂ input	P9 ₂ output	RxD ₀ input	RxD ₀ input

P9₁/TxD₁

Bit TE in SCR of SCI1, bit SMIF in SCMR, and bit P9₁DDR select the pin function as follows.

SMIF	0			1
TE	0		1	—
P9 ₁ DDR	0	1	—	—
Pin function	P9 ₁ input	P9 ₁ output	TxD ₁ output	TxD ₁ output*

Note: * Functions as the TxD₁ output pin, but there are two states: one in which the pin is driven, and another in which the pin is at high-impedance.

P9₀/TxD₀

Bit TE in SCR of SCI0, bit SMIF in SCMR, and bit P9₀DDR select the pin function as follows.

SMIF	0			1
TE	0		1	—
P9 ₀ DDR	0	1	—	—
Pin function	P9 ₀ input	P9 ₀ output	TxD ₀ output	TxD ₀ output*

Note: * Functions as the TxD₀ output pin, but there are two states: one in which the pin is driven, and another in which the pin is at high-impedance.

7.11 Port A

7.11.1 Overview

Port A is an 8-bit input/output port that is also used for output (TP₇ to TP₀) from the programmable timing pattern controller (TPC), input and output (TIOCB₂, TIOCA₂, TIOCB₁, TIOCA₁, TIOCB₀, TIOCA₀, TCLKD, TCLKC, TCLKB, TCLKA) by the 16-bit timer, clock input (TCLKD, TCLKC, TCLKB, TCLKA) to the 8-bit timer, and address output (A₂₃ to A₂₀). A reset or hardware standby transition leaves port A as an input port, except that in modes 3 and 4, one pin is always used for A₂₀ output. See table 7.19 to 7.21 for the selection of pin functions.

Usage of pins for TPC, 16-bit timer, and 8-bit timer input and output is described in the sections on those modules. For output of address bits A₂₃ to A₂₀ in modes 3, 4, and 5, see section 6.2.4, Bus Release Control Register (BRCR). Pins not assigned to any of these functions are available for generic input/output. Figure 7.10 shows the pin configuration of port A.

Pins in port A can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair. Port A has Schmitt-trigger inputs.

Figure 7.10 Port A Pin Configuration

7.11.2 Register Descriptions

Table 7.18 summarizes the registers of port A.

Table 7.18 Port A Registers

Address*	Name	PADDR	R/W	Initial Value	
				Modes 1, 2, 5, 6 and 7	Modes 3, 4
H'EE009	Port A data direction register	PADDR	W	H'00	H'80
H'FFFD9	Port A data register	PADR	R/W	H'00	H'00

Note: * Lower 20 bits of the address in advanced mode

Port A Data Direction Register (PADDR): PADDR is an 8-bit write-only register that can select input or output for each pin in port A. When pins are used for TPC output, the corresponding PADDR bits must also be set.

Bit		7	6	5	4	3	2	1	0
		PA ₇ DDR	PA ₆ DDR	PA ₅ DDR	PA ₄ DDR	PA ₃ DDR	PA ₂ DDR	PA ₁ DDR	PA ₀ DDR
Modes 3 and 4	Initial value	1	0	0	0	0	0	0	0
	Read/Write	—	W	W	W	W	W	W	W
Modes 1, 2, 5, 6 and 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	W	W	W	W	W	W	W	W

Port A data direction 7 to 0

These bits select input or output for port A pins

The pin functions that can be selected for pins PA₇ to PA₄ differ between modes 1, 2, 6, and 7, and modes 3 to 5. For the method of selecting the pin functions, see tables 7.19 and 7.20.

The pin functions that can be selected for pins PA₃ to PA₀ are the same in modes 1 to 7. For the method of selecting the pin functions, see table 7.21.

When port A functions as an input/output port, a pin in port A becomes an output port if the corresponding PADDR bit is set to 1, and an input port if this bit is cleared to 0. In modes 3 and 4, PA₇DDR is fixed at 1 and PA₇ functions as the A₂₀ address output pin.

PADDR is a write-only register. Its value cannot be read. All bits return 1 when read.

PADDR is initialized to H'00 by a reset and in hardware standby mode in modes 1, 2, 5, 6, and 7. It is initialized to H'80 by a reset and in hardware standby mode in modes 3 and 4. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port A is functioning as an input/output port and a PADDR bit is set to 1, the corresponding pin maintains its output state.

Port A Data Register (PADR): PADR is an 8-bit readable/writable register that stores output data for port A. When port A functions as an output port, the value of this register is output. When a bit in PADDR is set to 1, if port A is read the value of the corresponding PADR bit is returned. When a bit in PADDR is cleared to 0, if port A is read the corresponding pin logic level is read.

Bit	7	6	5	4	3	2	1	0

7.12 Port B

7.12.1 Overview

Port B is an 8-bit input/output port that is also used for output (TP₁₅ to TP₈) from the programmable timing pattern controller (TPC), input/output (TMIO₃, TMO₂, TMIO₁, TMO₀) by the 8-bit timer, and \overline{CS}_7 to \overline{CS}_4 output. See tables 7.23 and 7.24 for the selection of pin functions.

A reset or hardware standby transition leaves port B as an input/output port. For output of \overline{CS}_7 to \overline{CS}_4 in modes 1 to 5, see section 6.3.4, Chip Select Signals. Pins not assigned to any of these functions are available for generic input/output. Figure 7.11 shows the pin configuration of port B.

Pins in port B can drive one TTL load and a 30-pF capacitive load. They can also drive darlington transistor pair.

Figure 7.11 Port B Pin Configuration

7.12.2 Register Descriptions

Table 7.22 summarizes the registers of port B.

Table 7.22 Port B Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'EE0A	Port B data direction register	PBDDR	W	H'00
H'FFFA	Port B data register	PBDR	R/W	H'00

Note: * Lower 20 bits of the address in advanced mode.

Port B Data Direction Register (PBDDR): PBDDR is an 8-bit write-only register that can select input or output for each pin in port B. When pins are used for TPC output, the corresponding PBDDR bits must also be set.

Bit	7	6	5	4	3	2	1	0
	PB ₇ DDR	PB ₆ DDR	PB ₅ DDR	PB ₄ DDR	PB ₃ DDR	PB ₂ DDR	PB ₁ DDR	PB ₀ DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B data direction 7 to 0

These bits select input or output for port B pins

The pin functions that can be selected for port B differ between modes 1 to 5, and modes 6 and 7. For the method of selecting the pin functions, see tables 7.23 and 7.24.

When port B functions as an input/output port, a pin in port B becomes an output port if the corresponding PBDDR bit is set to 1, and an input port if this bit is cleared to 0.

PBDDR is a write-only register. Its value cannot be read. All bits return 1 when read.

PBDDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. Therefore, if a transition is made to software standby mode while port B is functioning as an input/output port and a PBDDR bit is set to 1, the corresponding pin maintains its output state.

Port B Data Register (PBDR): PBDR is an 8-bit readable/writable register that stores output data for pins port B. When port B functions as an output port, the value of this register is output. When a bit in PBDDR is set to 1, if port B is read the value of the corresponding PBDR bit is returned. When a bit in PBDDR is cleared to 0, if port B is read the corresponding pin logic level is read.

Bit	7	6	5	4	3	2	1	0
	PB ₇	PB ₆	PB ₅	PB ₄	PB ₃	PB ₂	PB ₁	PB ₀
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port B data 7 to 0

These bits store data for port B pins

PBDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 7.23 Port B Pin Functions (Modes 1 to 5)**Pin Pin Functions and Selection Method**

PB ₇ /TP ₁₅	Bit NDER15 in NDERB and bit PB ₇ DDR select the pin function as follows.

Section 8 16-Bit Timer

8.1 Overview

The H8/3062 Group has built-in 16-bit timer module with three 16-bit counter channels.

8.1.1 Features

16-bit timer features are listed below.

- Capability to process up to six pulse outputs or six pulse inputs
- Six general registers (GRs, two per channel) with independently-assignable output compare or input capture functions
- Selection of eight counter clock sources for each channel:
 - Internal clocks: ϕ , $\phi/2$, $\phi/4$, $\phi/8$
 - External clocks: TCLKA, TCLKB, TCLKC, TCLKD
- Five operating modes selectable in all channels:
 - Waveform output by compare match
 - Selection of 0 output, 1 output, or toggle output (only 0 or 1 output in channel 2)
 - Input capture function
 - Rising edge, falling edge, or both edges (selectable)
 - Counter clearing function
 - Counters can be cleared by compare match or input capture
 - Synchronization
 - Two or more timer counters (16TCNTs) can be preset simultaneously, or cleared simultaneously by compare match or input capture. Counter synchronization enables synchronous register input and output.
 - PWM mode
 - PWM output can be provided with an arbitrary duty cycle. With synchronization, up to three-phase PWM output is possible
- Phase counting mode selectable in channel 2
 - Two-phase encoder output can be counted automatically.
- High-speed access via internal 16-bit bus
 - The 16TCNTs and GRs can be accessed at high speed via a 16-bit bus.
- Any initial timer output value can be set

- Nine interrupt sources
Each channel has two compare match/input capture interrupts and an overflow interrupt. All interrupts can be requested independently.
- Output triggering of programmable timing pattern controller (TPC)
Compare match/input capture signals from channels 0 to 2 can be used as TPC output triggers.

Table 8.1 summarizes the 16-bit timer functions.

Table 8.1 16-bit timer Functions

Item		Channel 0	Channel 1	Channel 2
Clock sources		Internal clocks: ϕ , $\phi/2$, $\phi/4$, $\phi/8$ External clocks: TCLKA, TCLKB, TCLKC, TCLKD, selectable independently

Notes: 1. The lower 20 bits of the address in advanced mode are indicated.
 2. Only 0 can be written in bits 3 to 0, to clear the flags.

8.2 Register Descriptions

8.2.1 Timer Start Register (TSTR)

TSTR is an 8-bit readable/writable register that starts and stops the timer counter (16TCNT) in channels 0 to 2.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	STR2	STR1	STR0
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Reserved bits
Counter start 2 to 0
 These bits start and stop 16TCNT2 to 16TCNT0

TSTR is initialized to H'F8 by a reset and in standby mode.

Bits 7 to 3—Reserved: These bits cannot be modified and are always read as 1.

Bit 2—Counter Start 2 (STR2): Starts and stops timer counter 2 (16TCNT2).

Bit 2 STR2	Description	
0	16TCNT2 is halted	(Initial value)
1	16TCNT2 is counting	

Bit 1—Counter Start 1 (STR1): Starts and stops timer counter 1 (16TCNT1).

Bit 1 STR1	Description	
0	16TCNT1 is halted	(Initial value)
1	16TCNT1 is counting	

Bit 0—Counter Start 0 (STR0): Starts and stops timer counter 0 (16TCNT0).

Bit 0 STR0	Description	
0	16TCNT0 is halted	(Initial value)
1	16TCNT0 is counting	

8.2.2 Timer Synchro Register (TSNC)

TSNC is an 8-bit readable/writable register that selects whether channels 0 to 2 operate independently or synchronously. Channels are synchronized by setting the corresponding bits to 1.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SYNC2	SYNC1	SYNC0
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Reserved bits
Timer sync 2 to 0
 These bits synchronize channels 2 to 0

TSNC is initialized to H'F8 by a reset and in standby mode.

Bits 7 to 3—Reserved: These bits cannot be modified and are always read as 1.

Bit 2—Timer Sync 2 (SYNC2): Selects whether channel 2 operates independently or synchronously.

Bit 2 SYNC2	Description	
0	Channel 2's timer counter (16TCNT2) operates independently 16TCNT2 is preset and cleared independently of other channels	(Initial value)
1	Channel 2 operates synchronously 16TCNT2 can be synchronously preset and cleared	

Bit 1—Timer Sync 1 (SYNC1): Selects whether channel 1 operates independently or synchronously.

Bit 1 SYNC1	Description	
0	Channel 1's timer counter (16TCNT1) operates independently 16TCNT1 is preset and cleared independently of other channels	(Initial value)
1	Channel 1 operates synchronously 16TCNT1 can be synchronously preset and cleared	

Bit 0—Timer Sync 0 (SYNC0): Selects whether channel 0 operates independently or synchronously.

Bit 0 SYNC0	Description	
0	Channel 0's timer counter (16TCNT0) operates independently 16TCNT0 is preset and cleared independently of other channels	(Initial value)
1	Channel 0 operates synchronously 16TCNT0 can be synchronously preset and cleared	

8.2.3 Timer Mode Register (TMDR)

TMDR is an 8-bit readable/writable register that selects PWM mode for channels 0 to 2. It also selects phase counting mode and the overflow flag (OVF) setting conditions for channel 2.

Bit	7	6	5	4	3	2	1	0
	—	MDF	FDIR	—	—	PWM2	PWM1	PWM0
Initial value	1	0	0	1	1	0	0	0
Read/Write	—	R/W	R/W	—	—	R/W	R/W	R/W

Reserved bit
 These bits select PWM mode for channels 2 to 0

Flag direction
 Selects the setting condition for the overflow flag (OVF) in TISRC

Phase counting mode flag
 Selects phase counting mode for channel 2

Reserved bit

TMDR is initialized to H'98 by a reset and in standby mode.

Bit 7—Reserved: This bit cannot be modified and is always read as 1.

Bit 6—Phase Counting Mode Flag (MDF): Selects whether channel 2 operates normally or in phase counting mode.

Bit 6 MDF	Description	
0	Channel 2 operates normally	(Initial value)
1	Channel 2 operates in phase counting mode	

When MDF is set to 1 to select phase counting mode, 16TCNT2 operates as an up/down-counter and pins TCLKA and TCLKB become counter clock input pins. 16TCNT2 counts both rising and falling edges of TCLKA and TCLKB, and counts up or down as follows.

Counting Direction	Down-Counting				Up-Counting			
TCLKA pin		High		Low	Low		High	
TCLKB pin	Low		High			High		Low

In phase counting mode, external clock edge selection by bits CKEG1 and CKEG0 in 16TCR2 and counter clock selection by bits TPSC2 to TPSC0 are invalid, and the above phase counting mode operations take precedence.

The counter clearing condition selected by the CCLR1 and CCLR0 bits in 16TCR2 and the compare match/input capture settings and interrupt functions of TIOR2, TISRA, TISRB, TISRC remain effective in phase counting mode.

Bit 5—Flag Direction (FDIR): Designates the setting condition for the OVF flag in TISRC. The FDIR designation is valid in all modes in channel 2.

Bit 5 FDIR	Description
0	OVF is set to 1 in TISRC when 16TCNT2 overflows or underflows (Initial value)
1	OVF is set to 1 in TISRC when 16TCNT2 overflows

Bits 4 and 3—Reserved: These bits cannot be modified and are always read as 1.

Bit 2—PWM Mode 2 (PWM2): Selects whether channel 2 operates normally or in PWM mode.

Bit 2 PWM2	Description
0	Channel 2 operates normally (Initial value)
1	Channel 2 operates in PWM mode

When bit PWM2 is set to 1 to select PWM mode, pin TIOCA₂ becomes a PWM output pin. The output goes to 1 at compare match with GRA2, and to 0 at compare match with GRB2.

Bit 1—PWM Mode 1 (PWM1): Selects whether channel 1 operates normally or in PWM mode.

Bit 1

PWM1	Description	
0	Channel 1 operates normally	(Initial value)
1	Channel 1 operates in PWM mode	

When bit PWM1 is set to 1 to select PWM mode, pin TIOCA₁ becomes a PWM output pin. The output goes to 1 at compare match with GRA1, and to 0 at compare match with GRB1.

Bit 0—PWM Mode 0 (PWM0): Selects whether channel 0 operates normally or in PWM mode.

Bit 0

PWM0	Description	
0	Channel 0 operates normally	(Initial value)
1	Channel 0 operates in PWM mode	

When bit PWM0 is set to 1 to select PWM mode, pin TIOCA₀ becomes a PWM output pin. The output goes to 1 at compare match with GRA0, and to 0 at compare match with GRB0.

8.2.4 Timer Interrupt Status Register A (TISRA)

TISRA is an 8-bit readable/writable register that indicates GRA compare match or input capture and enables or disables GRA compare match and input capture interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	IMIEA2	IMIEA1	IMIEA0	—	IMFA2	IMFA1	IMFA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/(W)*	R/(W)*	R/(W)*

Reserved bit
Input capture/compare match interrupt enable A2 to A0
 These bits enable or disable interrupts by the IMFA flags

Reserved bit
Input capture/compare match flags A2 to A0
 Status flags indicating GRA compare match or input capture

Note: * Only 0 can be written, to clear the flag.

TISRA is initialized to H'88 by a reset and in standby mode.

Bit 7—Reserved: This bit cannot be modified and is always read as 1.

Bit 6—Input Capture/Compare Match Interrupt Enable A2 (IMIEA2): Enables or disables the interrupt requested by the IMFA2 when IMFA2 flag is set to 1.

Bit 6

IMIEA2	Description	
0	IMIA2 interrupt requested by IMFA2 flag is disabled	(Initial value)
1	IMIA2 interrupt requested by IMFA2 flag is enabled	

Bit 5—Input Capture/Compare Match Interrupt Enable A1 (IMIEA1): Enables or disables the interrupt requested by the IMFA1 flag when IMFA1 is set to 1.

Bit 5

IMIEA1	Description
0	IMIA1 interrupt requested by IMFA1 flag is disabled (Initial value)
1	IMIA1 interrupt requested by IMFA1 flag is enabled

Bit 4—Input Capture/Compare Match Interrupt Enable A0 (IMIEA0): Enables or disables the interrupt requested by the IMFA0 flag when IMFA0 is set to 1.

Bit 4

IMIEA0	Description
0	IMIA0 interrupt requested by IMFA0 flag is disabled (Initial value)
1	IMIA0 interrupt requested by IMFA0 flag is enabled

Bit 3—Reserved: This bit cannot be modified and is always read as 1.

Bit 2—Input Capture/Compare Match Flag A2 (IMFA2): This status flag indicates GRA2 compare match or input capture events.

Bit 2

IMFA2	Description
0	[Clearing condition] (Initial value) Read IMFA2 flag when IMFA2 =1, then write 0 in IMFA2 flag
1	[Setting conditions] <ul style="list-style-type: none"> 16TCNT2 = GRA2 when GRA2 functions as an output compare register 16TCNT2 value is transferred to GRA2 by an input capture signal when GRA2 functions as an input capture register

Bit 1—Input Capture/Compare Match Flag A1 (IMFA1): This status flag indicates GRA1 compare match or input capture events.

Bit 1	
IMFA1	Description
0	[Clearing condition] (Initial value) Read IMFA1 flag when IMFA1 =1, then write 0 in IMFA1 flag
1	[Setting conditions] <ul style="list-style-type: none"> • 16TCNT1 = GRA1 when GRA1 functions as an output compare register • 16TCNT1 value is transferred to GRA1 by an input capture signal when GRA1 functions as an input capture register

Bit 0—Input Capture/Compare Match Flag A0 (IMFA0): This status flag indicates GRA0 compare match or input capture events.

Bit 0	
IMFA0	Description
0	[Clearing condition] (Initial value) Read IMFA0 flag when IMFA0 =1, then write 0 in IMFA0 flag
1	[Setting conditions] <ul style="list-style-type: none"> • 16TCNT0 = GRA0 when GRA0 functions as an output compare register • 16TCNT0 value is transferred to GRA0 by an input capture signal when GRA0 functions as an input capture register

8.2.5 Timer Interrupt Status Register B (TISRB)

TISRB is an 8-bit readable/writable register that indicates GRB compare match or input capture and enables or disables GRB compare match and input capture interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	IMIEB2	IMIEB1	IMIEB0	—	IMFB2	IMFB1	IMFB0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/(W)*	R/(W)*	R/(W)*

Reserved bit
Input capture/compare match interrupt enable B2 to B0
 These bits enable or disable interrupts by the IMFB flags

Reserved bit
Input capture/compare match flags B2 to B0
 Status flags indicating GRB compare match or input capture

Note: * Only 0 can be written, to clear the flag.

TISRB is initialized to H'88 by a reset and in standby mode.

Bit 7—Reserved: This bit cannot be modified and is always read as 1.

Bit 6—Input Capture/Compare Match Interrupt Enable B2 (IMIEB2): Enables or disables the interrupt requested by the IMFB2 when IMFB2 flag is set to 1.

Bit 6

IMIEB2	Description
0	IMIEB2 interrupt requested by IMFB2 flag is disabled (Initial value)
1	IMIEB2 interrupt requested by IMFB2 flag is enabled

Bit 5—Input Capture/Compare Match Interrupt Enable B1 (IMIEB1): Enables or disables the interrupt requested by the IMFB1 when IMFB1 flag is set to 1.

Bit 5

IMIEB1	Description	
0	IMIB1 interrupt requested by IMFB1 flag is disabled	(Initial value)
1	IMIB1 interrupt requested by IMFB1 flag is enabled	

Bit 4—Input Capture/Compare Match Interrupt Enable B0 (IMIEB0): Enables or disables the interrupt requested by the IMFB0 when IMFB0 flag is set to 1.

Bit 4

IMIEB0	Description	
0	IMIB0 interrupt requested by IMFB0 flag is disabled	(Initial value)
1	IMIB0 interrupt requested by IMFB0 flag is enabled	

Bit 3—Reserved: This bit cannot be modified and is always read as 1.

Bit 2—Input Capture/Compare Match Flag B2 (IMFB2): This status flag indicates GRB2 compare match or input capture events.

Bit 2

IMFB2	Description	
0	[Clearing condition] Read IMFB2 flag when IMFB2 =1, then write 0 in IMFB2 flag	(Initial value)
1	[Setting conditions] <ul style="list-style-type: none"> • 16TCNT2 = GRB2 when GRB2 functions as an output compare register • 16TCNT2 value is transferred to GRB2 by an input capture signal when GRB2 functions as an input capture register 	

Bit 1—Input Capture/Compare Match Flag B1 (IMFB1): This status flag indicates GRB1 compare match or input capture events.

Bit 1 IMFB1	Description
0	[Clearing condition] (Initial value) Read IMFB1 flag when IMFB1 =1, then write 0 in IMFB1 flag
1	[Setting conditions] <ul style="list-style-type: none"> • 16TCNT1 = GRB1 when GRB1 functions as an output compare register • 16TCNT1 value is transferred to GRB1 by an input capture signal when GRB1 functions as an input capture register

Bit 0—Input Capture/Compare Match Flag B0 (IMFB0): This status flag indicates GRB0 compare match or input capture events.

Bit 0 IMFB0	Description
0	[Clearing condition] (Initial value) Read IMFB0 flag when IMFB0 =1, then write 0 in IMFB0 flag
1	[Setting conditions] <ul style="list-style-type: none"> • 16TCNT0 = GRB0 when GRB0 functions as an output compare register • 16TCNT0 value is transferred to GRB0 by an input capture signal when GRB0 functions as an input capture register

8.2.6 Timer Interrupt Status Register C (TISRC)

TISRC is an 8-bit readable/writable register that indicates 16TCNT overflow or underflow and enables or disables overflow interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	OVIE2	OVIE1	OVIE0	—	OVF2	OVF1	OVF0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/(W)*	R/(W)*	R/(W)*

Reserved bit
Overflow interrupt enable 2 to 0
 These bits enable or disable interrupts by the OVF flags

Overflow flags 2 to 0
 Status flags indicating interrupts by OVF flags

Reserved bit

Note: * Only 0 can be written, to clear the flag.

TISRC is initialized to H'88 by a reset and in standby mode.

Bit 7—Reserved: This bit cannot be modified and is always read as 1.

Bit 6—Overflow Interrupt Enable 2 (OVIE2): Enables or disables the interrupt requested by the OVF2 when OVF2 flag is set to 1.

Bit 6

OVIE2	Description	
0	OVI2 interrupt requested by OVF2 flag is disabled	(Initial value)
1	OVI2 interrupt requested by OVF2 flag is enabled	

Bit 5—Overflow Interrupt Enable 1 (OVIE1): Enables or disables the interrupt requested by the OVF1 when OVF1 flag is set to 1.

Bit 5

OVIE1	Description
0	OVI1 interrupt requested by OVF1 flag is disabled (Initial value)
1	OVI1 interrupt requested by OVF1 flag is enabled

Bit 4—Overflow Interrupt Enable 0 (OVIE0): Enables or disables the interrupt requested by the OVF0 when OVF0 flag is set to 1.

Bit 4

OVIE0	Description
0	OVI0 interrupt requested by OVF0 flag is disabled (Initial value)
1	OVI0 interrupt requested by OVF0 flag is enabled

Bit 3—Reserved: This bit cannot be modified and is always read as 1.

Bit 2—Overflow Flag 2 (OVF2): This status flag indicates 16TCNT2 overflow.

Bit 2

OVF2	Description
0	[Clearing condition] (Initial value) Read OVF2 flag when OVF2 =1, then write 0 in OVF2 flag
1	[Setting condition] 16TCNT2 overflowed from H'FFFF to H'0000, or underflowed from H'0000 to H'FFFF

Note: 16TCNT underflow occurs when 16TCNT operates as an up/down-counter. Underflow occurs only when channel 2 operates in phase counting mode (MDF = 1 in TMDR).

Bit 1—Overflow Flag 1 (OVF1): This status flag indicates 16TCNT1 overflow.

Bit 1

OVF1	Description
0	[Clearing condition] (Initial value) Read OVF1 flag when OVF1 =1, then write 0 in OVF1 flag
1	[Setting condition] 16TCNT1 overflowed from H'FFFF to H'0000

Bit 0—Overflow Flag 0 (OVF0): This status flag indicates 16TCNT0 overflow.

Bit 0 OVF0	Description	
0	[Clearing condition] Read OVF0 flag when OVF0 =1, then write 0 in OVF0 flag	(Initial value)
1	[Setting condition] 16TCNT0 overflowed from H'FFFF to H'0000	

8.2.7 Timer Counters (16TCNT)

16TCNT is a 16-bit counter. The 16-bit timer has three 16TCNTs, one for each channel.

Channel	Abbreviation	Function
0	16TCNT0	Up-counter
1	16TCNT1	
2	16TCNT2	Phase counting mode: up/down-counter Other modes: up-counter

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Each 16TCNT is a 16-bit readable/writable register that counts pulse inputs from a clock source. The clock source is selected by bits TPSC2 to TPSC0 in 16TCR.

16TCNT0 and 16TCNT1 are up-counters. 16TCNT2 is an up/down-counter in phase counting mode and an up-counter in other modes.

16TCNT can be cleared to H'0000 by compare match with GRA or GRB or by input capture to GRA or GRB (counter clearing function).

When 16TCNT overflows (changes from H'FFFF to H'0000), the OVF flag is set to 1 in TISRC of the corresponding channel.

When 16TCNT underflows (changes from H'0000 to H'FFFF), the OVF flag is set to 1 in TISRC of the corresponding channel.

The 16TCNTs are linked to the CPU by an internal 16-bit bus and can be written or read by either word access or byte access.

Each 16TCNT is initialized to H'0000 by a reset and in standby mode.

8.2.8 General Registers (GRA, GRB)

The general registers are 16-bit registers. The 16-bit timer has 6 general registers, two in each channel.

Channel	Abbreviation	Function
0	GRA0, GRB0	Output compare/input capture register
1	GRA1, GRB1	
2	GRA2, GRB2	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A general register is a 16-bit readable/writable register that can function as either an output compare register or an input capture register. The function is selected by settings in TIOR.

When a general register is used as an output compare register, its value is constantly compared with the 16TCNT value. When the two values match (compare match), the IMFA or IMFB flag is set to 1 in TISRA/TISRB. Compare match output can be selected in TIOR.

When a general register is used as an input capture register, an external input capture signal are detected and the current 16TCNT value is stored in the general register. The corresponding IMFA or IMFB flag in TISRA/TISRB is set to 1 at the same time. The edges of the input capture signal are selected in TIOR.

TIOR settings are ignored in PWM mode.

General registers are linked to the CPU by an internal 16-bit bus and can be written or read by either word access or byte access.

General registers are set as output compare registers (with no pin output) and initialized to H'FFFF by a reset and in standby mode.

8.2.9 Timer Control Registers (16TCR)

16TCR is an 8-bit register. The 16-bit timer has three 16TCRs, one in each channel.

Channel	Abbreviation	Function
0	16TCR0	16TCR controls the timer counter. The 16TCRs in all channels are functionally identical. When phase counting mode is selected in channel 2, the settings of bits CKEG1 and CKEG0 and TPSC2 to TPSC0 in 16TCR2 are ignored.
1	16TCR1	
2	16TCR2	

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bit
 Bit 7 is reserved.

Counter clear 1/0
 Bits 6 and 5 (CCLR1, CCLR0) select the counter clear source.

Clock edge 1/0
 Bits 4 and 3 (CKEG1, CKEG0) select external clock edges.

Timer prescaler 2 to 0
 Bits 2, 1, and 0 (TPSC2, TPSC1, TPSC0) select the timer counter clock.

Each 16TCR is an 8-bit readable/writable register that selects the timer counter clock source, selects the edge or edges of external clock sources, and selects how the counter is cleared.

16TCR is initialized to H'80 by a reset and in standby mode.

Bit 7—Reserved: This bit cannot be modified and is always read as 1.

Bits 6 and 5—Counter Clear 1 and 0 (CCLR1, CCLR0): These bits select how 16TCNT is cleared.

Bit 6 CCLR1	Bit 5 CCLR0	Description
0	0	16TCNT is not cleared (Initial value)
	1	16TCNT is cleared by GRA compare match or input capture* ¹
1	0	16TCNT is cleared by GRB compare match or input capture* ¹
	1	Synchronous clear: 16TCNT is cleared in synchronization with other synchronized timers* ²

Notes: 1. 16TCNT is cleared by compare match when the general register functions as an output compare register, and by input capture when the general register functions as an input capture register.

2. Selected in TSNC.

Bits 4 and 3—Clock Edge 1 and 0 (CKEG1, CKEG0): These bits select external clock input edges when an external clock source is used.

Bit 4 CKEG1	Bit 3 CKEG0	Description
0	0	Count rising edges (Initial value)
	1	Count falling edges
1	—	Count both edges

When channel 2 is set to phase counting mode, bits CKEG1 and CKEG0 in 16TCR2 are ignored. Phase counting takes precedence.

Bits 2 to 0—Timer Prescaler 2 to 0 (TPSC2 to TPSC0): These bits select the counter clock source.

Bit 2 TPSC2	Bit 1 TPSC1	Bit 0 TPSC0	Function
0	0	0	Internal clock: ϕ (Initial value)
		1	Internal clock: $\phi/2$
	1	0	Internal clock: $\phi/4$
		1	Internal clock: $\phi/8$
1	0	0	External clock A: TCLKA input
		1	External clock B: TCLKB input
	1	0	External clock C: TCLKC input
		1	External clock D: TCLKD input

When bit TPSC2 is cleared to 0 an internal clock source is selected, and the timer counts only falling edges. When bit TPSC2 is set to 1 an external clock source is selected, and the timer counts the edges selected by bits CKEG1 and CKEG0.

When channel 2 is set to phase counting mode (MDF = 1 in TMDR), the settings of bits TPSC2 to TPSC0 in 16TCR2 are ignored. Phase counting takes precedence.

8.2.10 Timer I/O Control Register (TIOR)

TIOR is an 8-bit register. The 16-bit timer has three TIORs, one in each channel.

Channel	Abbreviation	Function
0	TIOR0	TIOR controls the general registers. Some functions differ in PWM mode.
1	TIOR1	
2	TIOR2	

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Reserved bit (Bit 7)
I/O control B2 to B0 (Bits 6, 5, 4)
 These bits select GRB functions
Reserved bit (Bit 3)
I/O control A2 to A0 (Bits 2, 1, 0)
 These bits select GRA functions

Each TIOR is an 8-bit readable/writable register that selects the output compare or input capture function for GRA and GRB, and specifies the functions of the TIORA and TIORB pins. If the output compare function is selected, TIOR also selects the type of output. If input capture is selected, TIOR also selects the edges of the input capture signal.

TIOR is initialized to H'88 by a reset and in standby mode.

Bit 7—Reserved: This bit cannot be modified and is always read as 1.

Bits 6 to 4—I/O Control B2 to B0 (IOB2 to IOB0): These bits select the GRB function.

Bit 6 IOB2	Bit 5 IOB1	Bit 4 IOB0	Function	
0	0	0	GRB is an output compare register	No output at compare match (Initial value)
		1		0 output at GRB compare match ^{*1}
	1	0	1 output at GRB compare match ^{*1}	
		1	Output toggles at GRB compare match (1 output in channel 2) ^{*1 *2}	
1	0	0	GRB is an input compare register	GRB captures rising edge of input
		1		GRB captures falling edge of input
	1	0	GRB captures both edges of input	
		1		

- Notes: 1. After a reset, the output conforms to the TOLR setting until the first compare match.
 2. Channel 2 output cannot be toggled by compare match. When this setting is made, 1 output is selected automatically.

Bit 3—Reserved: This bit cannot be modified and is always read as 1.

Bits 2 to 0—I/O Control A2 to A0 (IOA2 to IOA0): These bits select the GRA function.

Bit 2 IOA2	Bit 1 IOA1	Bit 0 IOA0	Function	
0	0	0	GRA is an output compare register	No output at compare match (Initial value)
		1		0 output at GRA compare match ^{*1}
	1	0	1 output at GRA compare match ^{*1}	
		1	Output toggles at GRA compare match (1 output in channel 2) ^{*1 *2}	
1	0	0	GRA is an input compare register	GRA captures rising edge of input
		1		GRA captures falling edge of input
	1	0	GRA captures both edges of input	
		1		

- Notes: 1. After a reset, the output conforms to the TOLR setting until the first compare match.
 2. Channel 2 output cannot be toggled by compare match. When this setting is made, 1 output is selected automatically.

8.2.11 Timer Output Level Setting Register C (TOLR)

TOLR is an 8-bit write-only register that selects the timer output level for channels 0 to 2.

Bit	7	6	5	4	3	2	1	0
	—	—	TOB2	TOA2	TOB1	TOA1	TOB0	TOA0
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	W	W	W	W	W	W

Output level setting A2 to A0, B2 to B0
 These bits set the levels of the timer outputs
 (TIOCA₂ to TIOCA₀, and TIOCB₂ to TIOCB₀)

Reserved bits

A TOLR setting can only be made when the corresponding bit in TSTR is 0.

TOLR is a write-only register, and cannot be read. If it is read, all bits will return a value of 1.

TOLR is initialized to H'C0 by a reset and in standby mode.

Bits 7 and 6—Reserved: These bits cannot be modified.

Bit 5—Output Level Setting B2 (TOB2): Sets the value of timer output TIOCB₂.

Bit 5 TOB2	Description
0	TIOCB ₂ is 0 (Initial value)
1	TIOCB ₂ is 1

Bit 4—Output Level Setting A2 (TOA2): Sets the value of timer output TIOCA₂.

Bit 4 TOA2	Description
0	TIOCA ₂ is 0 (Initial value)
1	TIOCA ₂ is 1

Bit 3—Output Level Setting B1 (TOB1): Sets the value of timer output TIOCB₁.

Bit 3	
TOB1	Description
0	TIOCB ₁ is 0 (Initial value)
1	TIOCB ₁ is 1

Bit 2—Output Level Setting A1 (TOA1): Sets the value of timer output TIOCA₁.

Bit 2	
TOA1	Description
0	TIOCA ₁ is 0 (Initial value)
1	TIOCA ₁ is 1

Bit 1—Output Level Setting B0 (TOB0): Sets the value of timer output TIOCB₀.

Bit 0	
TOB0	Description
0	TIOCB ₀ is 0 (Initial value)
1	TIOCB ₀ is 1

Bit 0—Output Level Setting A0 (TOA0): Sets the value of timer output TIOCA₀.

Bit 0	
TOA0	Description
0	TIOCA ₀ is 0 (Initial value)
1	TIOCA ₀ is 1

8.3 CPU Interface

8.3.1 16-Bit Accessible Registers

The timer counters (16TCNTs), general registers A and B (GRAs and GRBs) are 16-bit registers, and are linked to the CPU by an internal 16-bit data bus. These registers can be written or read a word at a time, or a byte at a time.

Figures 8.4 and 8.5 show examples of word read/write access to a timer counter (16TCNT). Figures 8.6 to 8.9 show examples of byte read/write access to 16TCNTH and 16TCNTL.

Figure 8.4 16TCNT Access Operation [CPU → 16TCNT (Word)]

Figure 8.5 Access to Timer Counter (CPU Reads 16TCNT, Word)

Figure 8.6 Access to Timer Counter H (CPU Writes to 16TCNTH, Upper Byte)

Figure 8.7 Access to Timer Counter L (CPU Writes to 16TCNTL, Lower Byte)

Figure 8.8 Access to Timer Counter H (CPU Reads 16TCNTH, Upper Byte)

Figure 8.9 Access to Timer Counter L (CPU Reads 16TCNTL, Lower Byte)

8.3.2 8-Bit Accessible Registers

The registers other than the timer counters and general registers are 8-bit registers. These registers are linked to the CPU by an internal 8-bit data bus.

Figures 8.10 and 8.11 show examples of byte read and write access to a 16TCR.

If a word-size data transfer instruction is executed, two byte transfers are performed.

Figure 8.10 16TCR Access (CPU Writes to 16TCR)

Figure 8.11 16TCR Access (CPU Reads 16TCR)

8.4 Operation

8.4.1 Overview

A summary of operations in the various modes is given below.

Normal Operation: Each channel has a timer counter (16TCNT) and general registers. The 16TCNT counts up, and can operate as a free-running counter, periodic counter, or external event counter. GRA and GRB can be used for input capture or output compare.

Synchronous Operation: The timer counters in designated channels are preset synchronously. Data written to the timer counter in any one of these channels is simultaneously written to the timer counters in the other channels as well. The timer counters can also be cleared synchronously if so designated by the CCLR1 and CCLR0 bits in the TCRs.

PWM Mode: A PWM waveform is output from the TIOCA pin. The output goes to 1 at compare match A and to 0 at compare match B. The duty cycle can be varied from 0% to 100% depending on the settings of GRA and GRB. When a channel is set to PWM mode, its GRA and GRB automatically become output compare registers.

Phase Counting Mode: The phase relationship between two clock signals input at TCLKA and TCLKB is detected and 16TCNT2 counts up or down accordingly. When phase counting mode is selected TCLKA and TCLKB become clock input pins and 16TCNT2 operates as an up/down-counter.

8.4.2 Basic Functions

Counter Operation: When one of bits STR0 to STR2 is set to 1 in the timer start register (TSTR), 16TCNT in the corresponding channel starts counting. The counting can be free-running or periodic.

- Sample setup procedure for counter

Figure 8.12 shows a sample procedure for setting up a counter.

Figure 8.12 Counter Setup Procedure (Example)

1. Set bits TPSC2 to TPSC0 in 16TCR to select the counter clock source. If an external clock source is selected, set bits CKEG1 and CKEG0 in 16TCR to select the desired edge(s) of the external clock signal.

2. For periodic counting, set CCLR1 and CCLR0 in 16TCR to have 16TCNT cleared at GRA compare match or GRB compare match.
 3. Set TIOR to select the output compare function of GRA or GRB, whichever was selected in step 2.
 4. Write the count period in GRA or GRB, whichever was selected in step 2.
 5. Set the STR bit to 1 in TSTR to start the timer counter.
- Free-running and periodic counter operation

A reset leaves the counters (16TCNTs) in 16-bit timer channels 0 to 2 all set as free-running counters. A free-running counter starts counting up when the corresponding bit in TSTR is set to 1. When the count overflows from H'FFFF to H'0000, the OVF flag is set to 1 in TISRC. After the overflow, the counter continues counting up from H'0000. Figure 8.13 illustrates free-running counting.

Figure 8.13 Free-Running Counter Operation

When a channel is set to have its counter cleared by compare match, in that channel 16TCNT operates as a periodic counter. Select the output compare function of GRA or GRB, set bit CCLR1 or CCLR0 in 16TCR to have the counter cleared by compare match, and set the count period in GRA or GRB. After these settings, the counter starts counting up as a periodic counter when the corresponding bit is set to 1 in TSTR. When the count matches GRA or GRB, the IMFA or IMFB flag is set to 1 in TISRA/TISRB and the counter is cleared to H'0000. If the corresponding IMIEA or IMIEB bit is set to 1 in TISRA/TISRB, a CPU interrupt is requested at this time. After the compare match, 16TCNT continues counting up from H'0000. Figure 8.14 illustrates periodic counting.

Figure 8.14 Periodic Counter Operation

- 16TCNT count timing

- Internal clock source

Bits TPSC2 to TPSC0 in 16TCR select the system clock (ϕ) or one of three internal clock sources obtained by prescaling the system clock ($\phi/2$, $\phi/4$, $\phi/8$).

Figure 8.15 shows the timing.

Figure 8.15 Count Timing for Internal Clock Sources

- External clock source

The external clock pin (TCLKA to TCLKD) can be selected by bits TPSC2 to TPSC0 in 16TCR, and the detected edge by bits CKEG1 and CKEG0. The rising edge, falling edge, or both edges can be selected.

The pulse width of the external clock signal must be at least 1.5 system clocks when a single edge is selected, and at least 2.5 system clocks when both edges are selected. Shorter pulses will not be counted correctly.

Figure 8.16 shows the timing when both edges are detected.

Figure 8.16 Count Timing for External Clock Sources (when Both Edges are Detected)

Waveform Output by Compare Match: In 16-bit timer channels 0, 1 compare match A or B can cause the output at the TIOCA or TIOCB pin to go to 0, go to 1, or toggle. In channel 2 the output can only go to 0 or go to 1.

- Sample setup procedure for waveform output by compare match

Figure 8.17 shows an example of the setup procedure for waveform output by compare match.

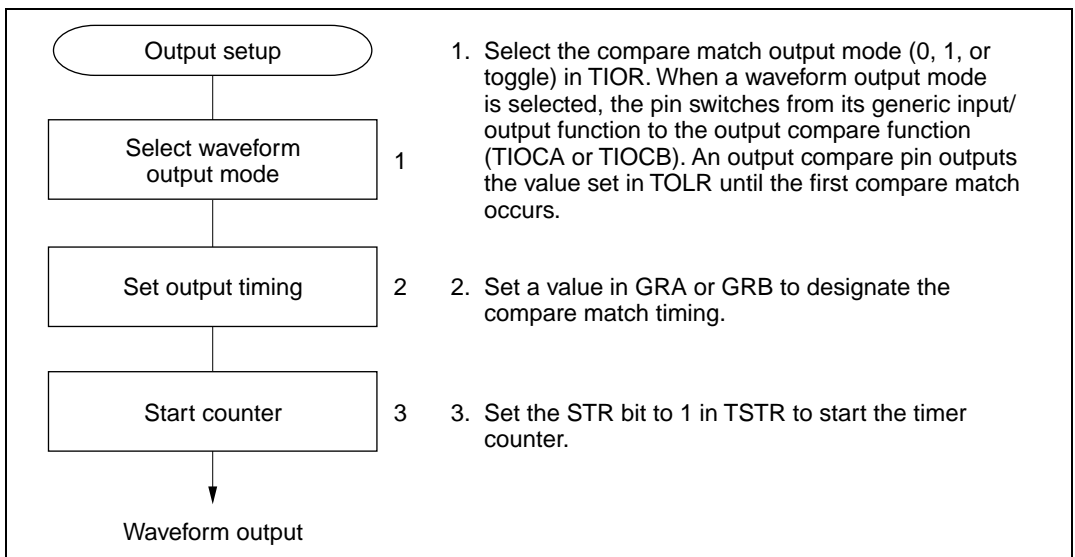

Figure 8.17 Setup Procedure for Waveform Output by Compare Match (Example)

- Examples of waveform output

Figure 8.18 shows examples of 0 and 1 output. 16TCNT operates as a free-running counter, 0 output is selected for compare match A, and 1 output is selected for compare match B. When the pin is already at the selected output level, the pin level does not change.

Figure 8.18 0 and 1 Output (TOA = 1, TOB = 0)

Figure 8.19 shows examples of toggle output. 16TCNT operates as a periodic counter, cleared by compare match B. Toggle output is selected for both compare match A and B.

Figure 8.19 Toggle Output (TOA = 1, TOB = 0)

- Output compare output timing

The compare match signal is generated in the last state in which 16TCNT and the general register match (when 16TCNT changes from the matching value to the next value). When the compare match signal is generated, the output value selected in TIOR is output at the output compare pin (TIOCA or TIOCB). When 16TCNT matches a general register, the compare match signal is not generated until the next counter clock pulse.

Figure 8.20 shows the output compare timing.

Figure 8.20 Output Compare Output Timing

Input Capture Function: The 16TCNT value can be transferred to a general register when an input edge is detected at an input capture input/output compare pin (TIOCA or TIOCB). Rising-edge, falling-edge, or both-edge detection can be selected. The input capture function can be used to measure pulse width or period.

- Sample setup procedure for input capture

Figure 8.21 shows a sample procedure for setting up input capture.

Figure 8.21 Setup Procedure for Input Capture (Example)

- Examples of input capture

Figure 8.22 illustrates input capture when the falling edge of TIOCB and both edges of TIOCA are selected as capture edges. 16TCNT is cleared by input capture into GRB.

Figure 8.22 Input Capture (Example)

- Input capture signal timing

Input capture on the rising edge, falling edge, or both edges can be selected by settings in TIOR. Figure 8.23 shows the timing when the rising edge is selected. The pulse width of the input capture signal must be at least 1.5 system clocks for single-edge capture, and 2.5 system clocks for capture of both edges.

Figure 8.23 Input Capture Signal Timing

8.4.3 Synchronization

The synchronization function enables two or more timer counters to be synchronized by writing the same data to them simultaneously (synchronous preset). With appropriate 16TCR settings, two or more timer counters can also be cleared simultaneously (synchronous clear). Synchronization enables additional general registers to be associated with a single time base. Synchronization can be selected for all channels (0 to 2).

Sample Setup Procedure for Synchronization: Figure 8.24 shows a sample procedure for setting up synchronization.

Figure 8.24 Setup Procedure for Synchronization (Example)

Example of Synchronization: Figure 8.25 shows an example of synchronization. Channels 0, 1, and 2 are synchronized, and are set to operate in PWM mode. Channel 0 is set for counter clearing by compare match with GRB0. Channels 1 and 2 are set for synchronous counter clearing. The timer counters in channels 0, 1, and 2 are synchronously preset, and are synchronously cleared by compare match with GRB0. A three-phase PWM waveform is output from pins TIOCA₀, TIOCA₁, and TIOCA₂. For further information on PWM mode, see section 8.4.4, PWM Mode.

Figure 8.25 Synchronization (Example)

8.4.4 PWM Mode

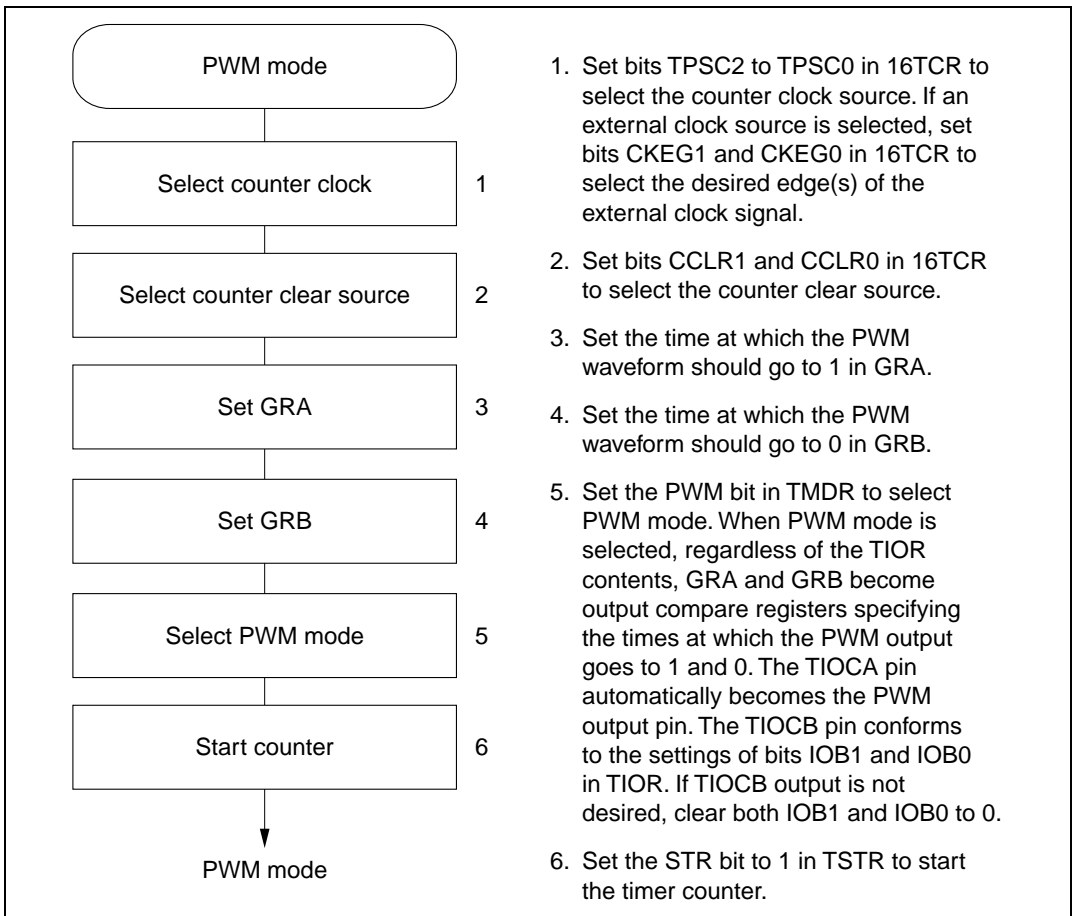

In PWM mode GRA and GRB are paired and a PWM waveform is output from the TIOCA pin. GRA specifies the time at which the PWM output changes to 1. GRB specifies the time at which the PWM output changes to 0. If either GRA or GRB compare match is selected as the counter clear source, a PWM waveform with a duty cycle from 0% to 100% is output at the TIOCA pin. PWM mode can be selected in all channels (0 to 2).

Table 8.4 summarizes the PWM output pins and corresponding registers. If the same value is set in GRA and GRB, the output does not change when compare match occurs.

Table 8.4 PWM Output Pins and Registers

Channel	Output Pin	1 Output	0 Output
0	TIOCA ₀	GRA0	GRB0
1	TIOCA ₁	GRA1	GRB1
2	TIOCA ₂	GRA2	GRB2

Sample Setup Procedure for PWM Mode: Figure 8.26 shows a sample procedure for setting up PWM mode.

**Figure 8.26 Setup Procedure for PWM Mode (Example)**

Examples of PWM Mode: Figure 8.27 shows examples of operation in PWM mode. In PWM mode TIOCA becomes an output pin. The output goes to 1 at compare match with GRA, and to 0 at compare match with GRB.

In the examples shown, 16TCNT is cleared by compare match with GRA or GRB. Synchronized operation and free-running counting are also possible.

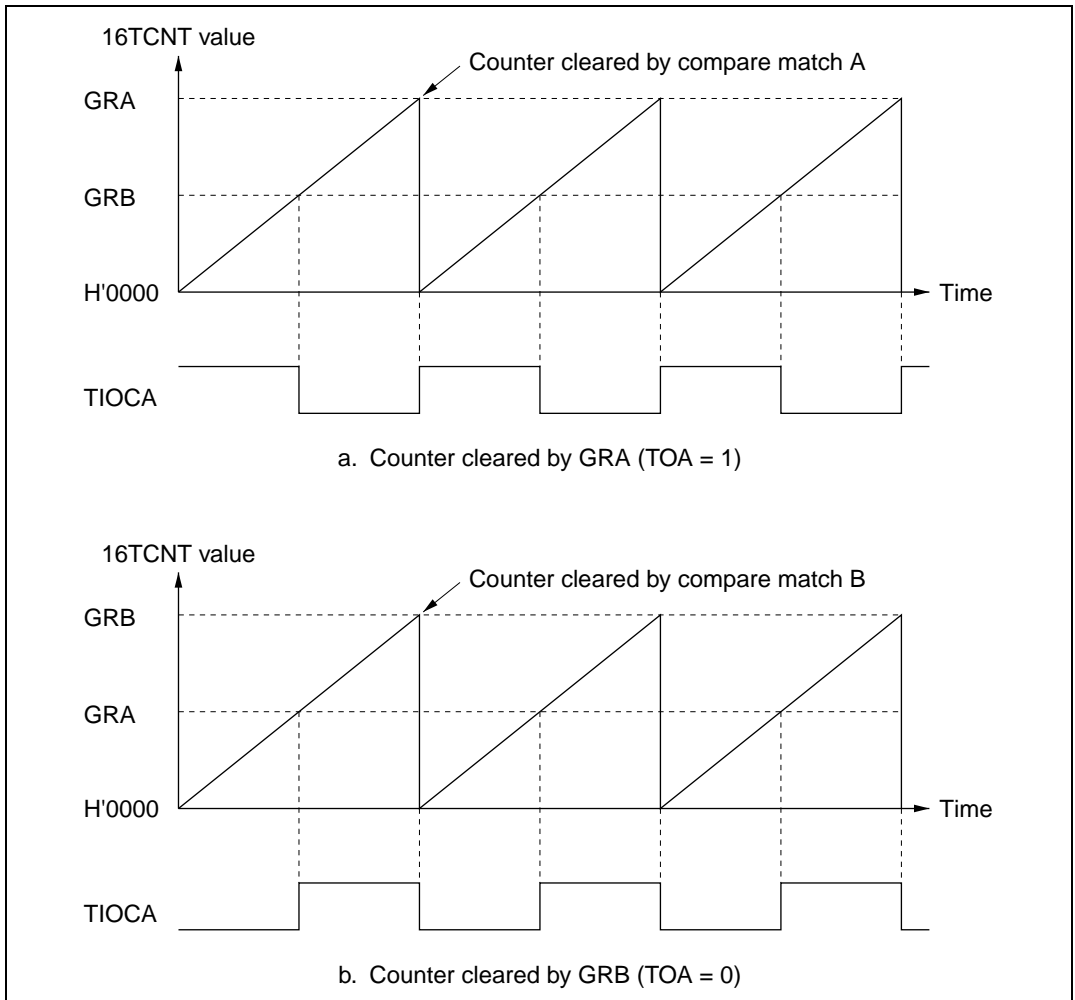

Figure 8.27 PWM Mode (Example 1)

Figure 8.28 shows examples of the output of PWM waveforms with duty cycles of 0% and 100%. If the counter is cleared by compare match with GRB, and GRA is set to a higher value than GRB, the duty cycle is 0%. If the counter is cleared by compare match with GRA, and GRB is set to a higher value than GRA, the duty cycle is 100%.

Figure 8.28 PWM Mode (Example 2)

8.4.5 Phase Counting Mode

In phase counting mode the phase difference between two external clock inputs (at the TCLKA and TCLKB pins) is detected, and 16TCNT2 counts up or down accordingly.

In phase counting mode, the TCLKA and TCLKB pins automatically function as external clock input pins and 16TCNT2 becomes an up/down-counter, regardless of the settings of bits TPSC2 to TPSC0, CKEG1, and CKEG0 in 16TCR2. Settings of bits CCLR1, CCLR0 in 16TCR2, and settings in TIOR2, TISRA, TISRB, TISRC, setting of STR2 bit in TSTR, GRA2, and GRB2 are valid. The input capture and output compare functions can be used, and interrupts can be generated.

Phase counting is available only in channel 2.

Sample Setup Procedure for Phase Counting Mode: Figure 8.29 shows a sample procedure for setting up phase counting mode.

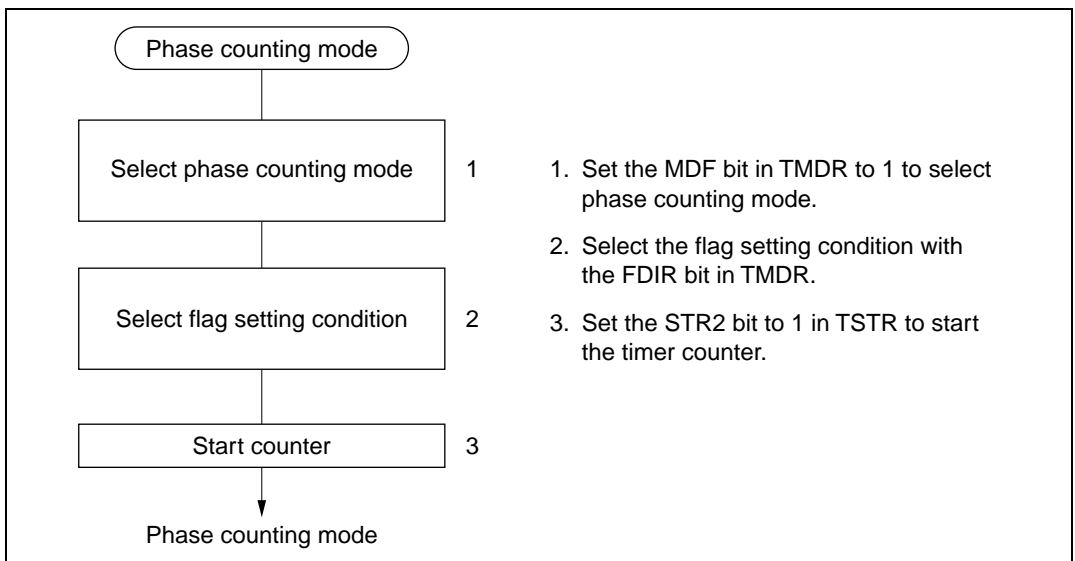

Figure 8.29 Setup Procedure for Phase Counting Mode (Example)

Example of Phase Counting Mode: Figure 8.30 shows an example of operations in phase counting mode. Table 8.5 lists the up-counting and down-counting conditions for 16TCNT2.

In phase counting mode both the rising and falling edges of TCLKA and TCLKB are counted. The phase difference between TCLKA and TCLKB must be at least 1.5 states, the phase overlap must also be at least 1.5 states, and the pulse width must be at least 2.5 states.

Figure 8.30 Operation in Phase Counting Mode (Example)

Table 8.5 Up/Down Counting Conditions

Counting Direction	Up-Counting				Down-Counting			
TCLKB pin		High		Low	High		Low	
TCLKA pin	Low		High				Low	

Figure 8.31 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

8.4.6 16-Bit Timer Output Timing

The initial value of 16-bit timer output when a timer count operation begins can be specified arbitrarily by making a setting in TOLR.

Figure 8.32 shows the timing for setting the initial value with TOLR.

Only write to TOLR when the corresponding bit in TSTR is cleared to 0.

Figure 8.32 Timing for Setting 16-Bit Timer Output Level by Writing to TOLR

8.5 Interrupts

The 16-bit timer has two types of interrupts: input capture/compare match interrupts, and overflow interrupts.

8.5.1 Setting of Status Flags

Timing of Setting of IMFA and IMFB at Compare Match: IMFA and IMFB are set to 1 by a compare match signal generated when 16TCNT matches a general register (GR). The compare match signal is generated in the last state in which the values match (when 16TCNT is updated from the matching count to the next count). Therefore, when 16TCNT matches a general register, the compare match signal is not generated until the next 16TCNT clock input. Figure 8.33 shows the timing of the setting of IMFA and IMFB.

Figure 8.33 Timing of Setting of IMFA and IMFB by Compare Match

Timing of Setting of IMFA and IMFB by Input Capture: IMFA and IMFB are set to 1 by an input capture signal. The 16TCNT contents are simultaneously transferred to the corresponding general register. Figure 8.34 shows the timing.

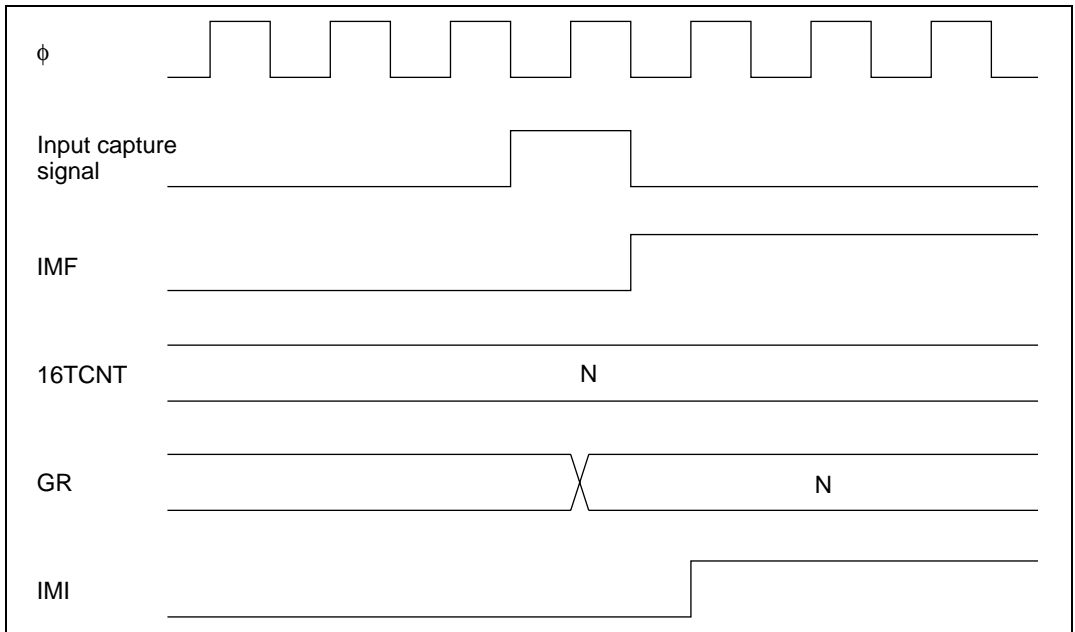

Figure 8.34 Timing of Setting of IMFA and IMFB by Input Capture

Timing of Setting of Overflow Flag (OVF): OVF is set to 1 when 16TCNT overflows from H'FFFF to H'0000 or underflows from H'0000 to H'FFFF. Figure 8.35 shows the timing.

Figure 8.35 Timing of Setting of OVF

8.5.2 Timing of Clearing of Status Flags

If the CPU reads a status flag while it is set to 1, then writes 0 in the status flag, the status flag is cleared. Figure 8.36 shows the timing.

Figure 8.36 Timing of Clearing of Status Flags

8.5.3 Interrupt Sources

Each 16-bit timer channel can generate a compare match/input capture A interrupt, a compare match/input capture B interrupt, and an overflow interrupt. In total there are nine interrupt sources of three kinds, all independently vectored. An interrupt is requested when the interrupt request flag are set to 1.

The priority order of the channels can be modified in interrupt priority registers A (IPRA). For details see section 5, Interrupt Controller.

Table 8.6 lists the interrupt sources.

Table 8.6 16-bit timer Interrupt Sources

Channel	Interrupt Source	Description	Priority*
0	IMIA0	Compare match/input capture A0	
	IMIB0	Compare match/input capture B0	
	OVI0	Overflow 0	
1	IMIA1	Compare match/input capture A1	
	IMIB1	Compare match/input capture B1	
	OVI1	Overflow 1	
2	IMIA2	Compare match/input capture A2	
	IMIB2	Compare match/input capture B2	
	OVI2	Overflow 2	

Note: * The priority immediately after a reset is indicated. Inter-channel priorities can be changed by settings in IPRA.

8.6 Usage Notes

This section describes contention and other matters requiring special attention during 16-bit timer operations.

Contention between 16TCNT Write and Clear: If a counter clear signal occurs in the T_3 state of a 16TCNT write cycle, clearing of the counter takes priority and the write is not performed. See figure 8.37.

Figure 8.37 Contention between 16TCNT Write and Clear

Contention between 16TCNT Word Write and Increment: If an increment pulse occurs in the T_3 state of a 16TCNT word write cycle, writing takes priority and 16TCNT is not incremented. Figure 8.38 shows the timing in this case.

Figure 8.38 Contention between 16TCNT Word Write and Increment

Contention between 16TCNT Byte Write and Increment: If an increment pulse occurs in the T_2 or T_3 state of a 16TCNT byte write cycle, writing takes priority and 16TCNT is not incremented. The byte data for which a write was not performed is not incremented, and retains its pre-write value. See figure 8.39, which shows an increment pulse occurring in the T_2 state of a byte write to 16TCNTH.

Figure 8.39 Contention between 16TCNT Byte Write and Increment

Contention between General Register Write and Compare Match: If a compare match occurs in the T_3 state of a general register write cycle, writing takes priority and the compare match signal is inhibited. See figure 8.40.

Figure 8.40 Contention between General Register Write and Compare Match

Contention between 16TCNT Write and Overflow or Underflow: If an overflow occurs in the T_3 state of a 16TCNT write cycle, writing takes priority and the counter is not incremented. OVF is set to 1. The same holds for underflow. See figure 8.41.

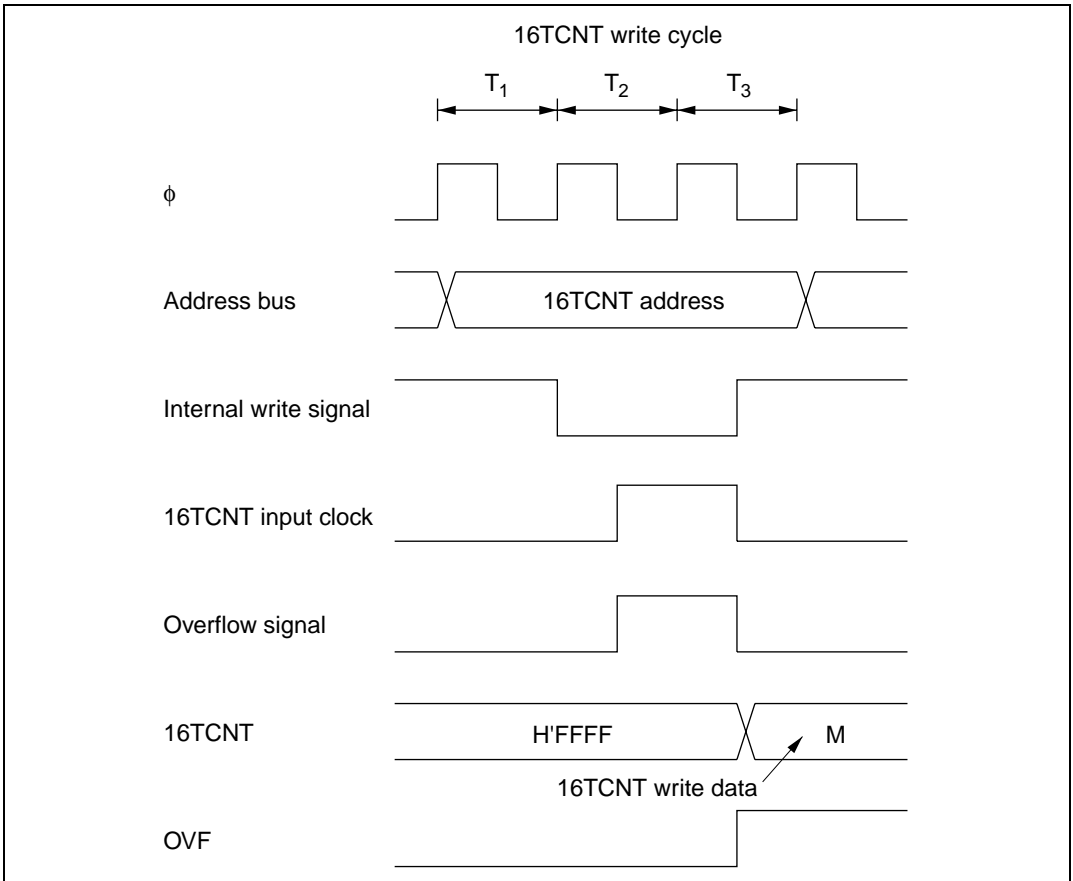

Figure 8.41 Contention between 16TCNT Write and Overflow

Contention between General Register Read and Input Capture: If an input capture signal occurs during the T_3 state of a general register read cycle, the value before input capture is read. See figure 8.42.

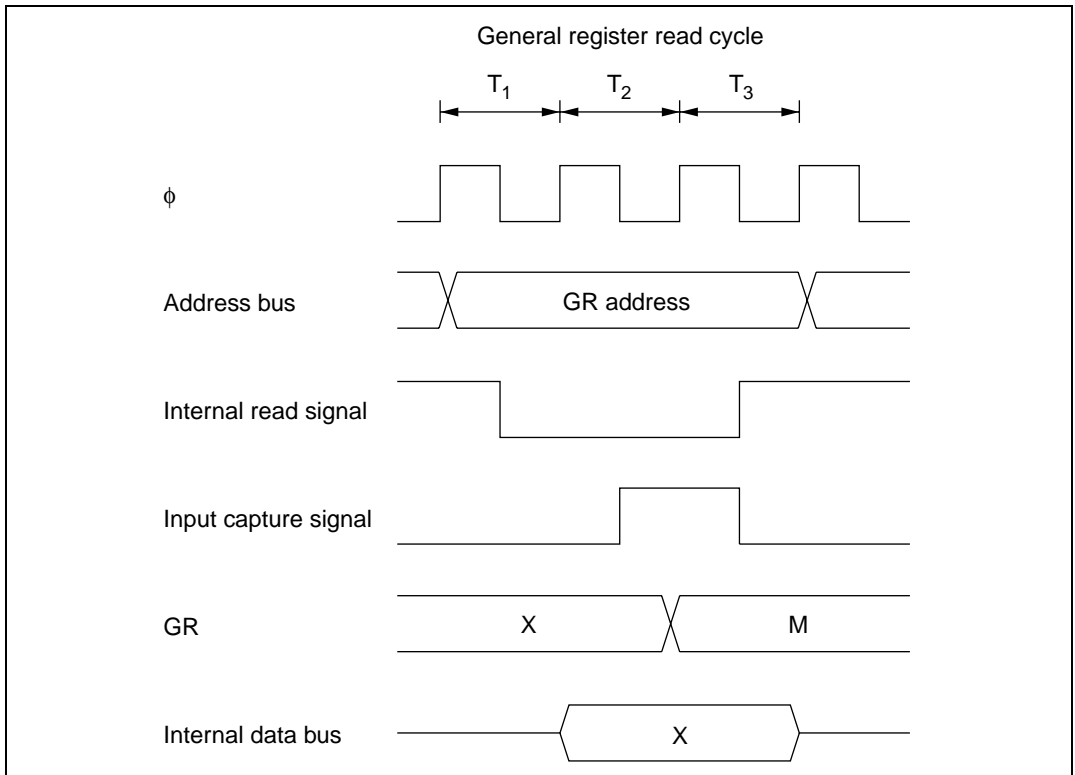

Figure 8.42 Contention between General Register Read and Input Capture

Contention between Counter Clearing by Input Capture and Counter Increment: If an input capture signal and counter increment signal occur simultaneously, the counter is cleared according to the input capture signal. The counter is not incremented by the increment signal. The value before the counter is cleared is transferred to the general register. See figure 8.43.

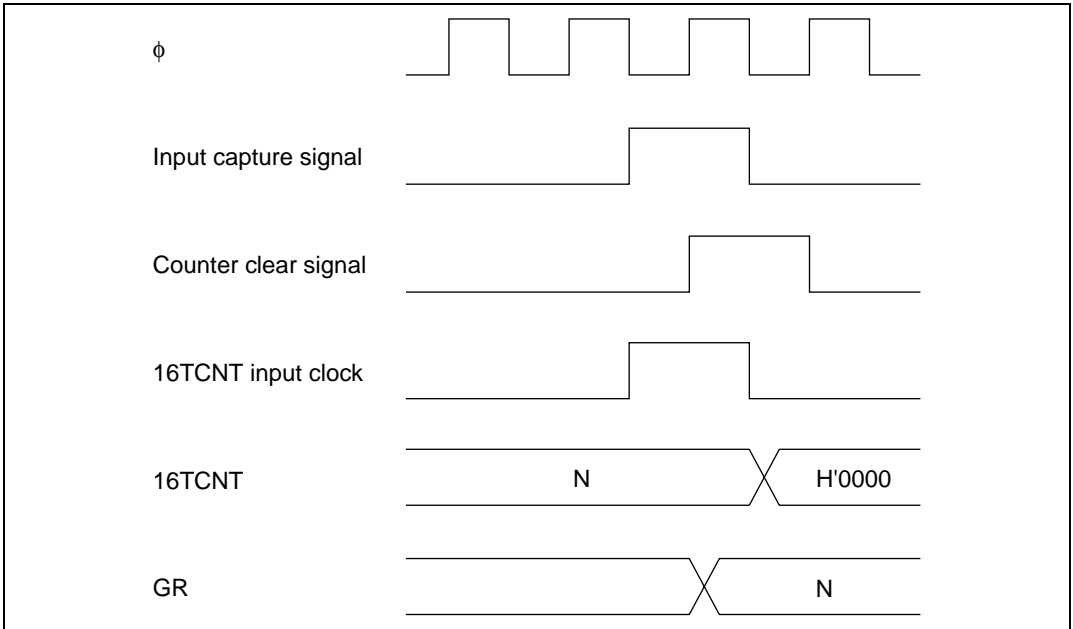

Figure 8.43 Contention between Counter Clearing by Input Capture and Counter Increment

Contention between General Register Write and Input Capture: If an input capture signal occurs in the T_3 state of a general register write cycle, input capture takes priority and the write to the general register is not performed. See figure 8.44.

Figure 8.44 Contention between General Register Write and Input Capture

Note on Waveform Period Setting: When a counter is cleared by compare match, the counter is cleared in the last state at which the 16TCNT value matches the general register value, at the time when this value would normally be updated to the next count. The actual counter frequency is therefore given by the following formula:

$$f = \frac{\phi}{(N+1)}$$

(f: counter frequency. ϕ : system clock frequency. N: value set in general register.)

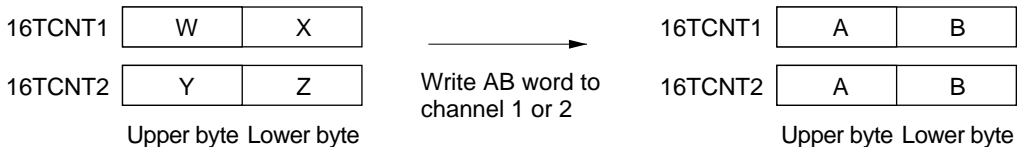

Note on Writes in Synchronized Operation: When channels are synchronized, if a 16TCNT value is modified by byte write access, all 16 bits of all synchronized counters assume the same value as the counter that was addressed.

(Example) When channels 1 and 2 are synchronized

- Byte write to channel 1 or byte write to channel 2

- Word write to channel 1 or word write to channel 2

16-bit Timer Operating Modes

Table 8.7 (a) 16-bit Timer Operating Modes (Channel 0)

Operating Mode		Register Settings								
		TSNC		TMDR			TIOR0		16TCR0

Section 9 8-Bit Timers

9.1 Overview

The H8/3062 Group has a built-in 8-bit timer module with four channels (TMR0, TMR1, TMR2, and TMR3), based on 8-bit counters. Each channel has an 8-bit timer counter (8TCNT) and two 8-bit time constant registers (TCORA and TCORB) that are constantly compared with the 8TCNT value to detect compare match events. The timers can be used as multifunctional timers in a variety of applications, including the generation of a rectangular-wave output with an arbitrary duty cycle.

9.1.1 Features

The features of the 8-bit timer module are listed below.

- Selection of four clock sources
The counters can be driven by one of three internal clock signals ($\phi/8$, $\phi/64$, or $\phi/8192$) or an external clock input (enabling use as an external event counter).
- Selection of three ways to clear the counters
The counters can be cleared on compare match A or B, or input capture B.
- Timer output controlled by two compare match signals
The timer output signal in each channel is controlled by two independent compare match signals, enabling the timer to generate output waveforms with an arbitrary duty cycle or PWM output.
- A/D converter can be activated by a compare match
- Two channels can be cascaded
 - Channels 0 and 1 can be operated as the upper and lower halves of a 16-bit timer (16-bit count mode).
 - Channels 2 and 3 can be operated as the upper and lower halves of a 16-bit timer (16-bit count mode).
 - Channel 1 can count channel 0 compare match events (compare match count mode).
 - Channel 3 can count channel 2 compare match events (compare match count mode).
- Input capture function can be set
8-bit or 16-bit input capture operation is available.

- Twelve interrupt sources

There are twelve interrupt sources: four compare match sources, four compare match/input capture sources, four overflow sources.

Two of the compare match sources and two of the combined compare match/input capture sources each have an independent interrupt vector. The remaining compare match interrupts, combined compare match/input capture interrupts, and overflow interrupts have one interrupt vector for two sources.

9.1.2 Block Diagram

The 8-bit timers are divided into two groups of two channels each: group 0 comprising channels 0 and 1, and group 1 comprising channels 2 and 3. Figure 9.1 shows a block diagram of 8-bit timer group 0.

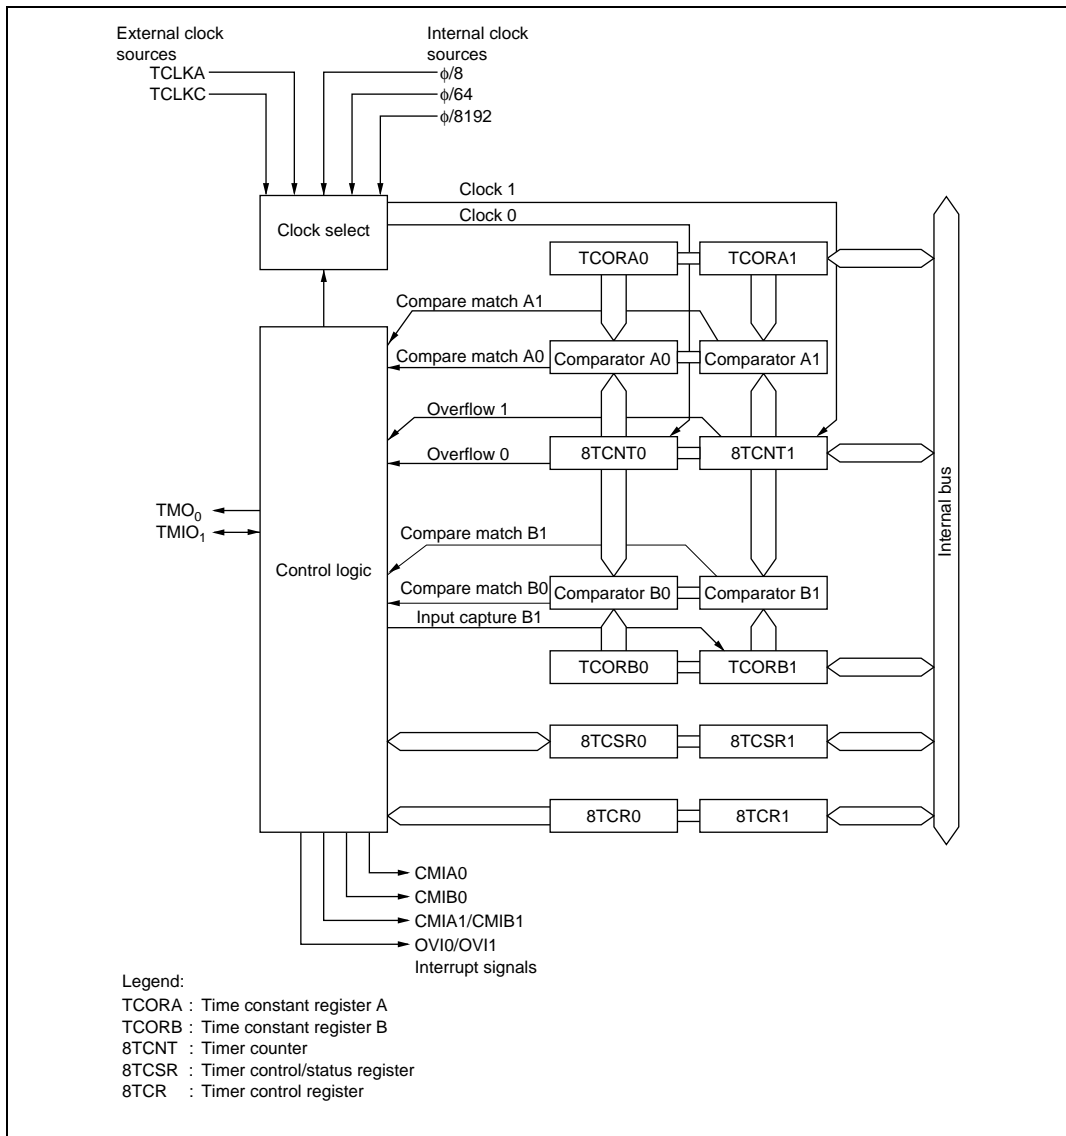

Figure 9.1 Block Diagram of 8-Bit Timer Unit (Two Channels: Group 0)

9.1.3 Pin Configuration

Table 9.1 summarizes the input/output pins of the 8-bit timer module.

Table 9.1 8-Bit Timer Pins

Group	Channel	Name	Abbreviation	I/O	Function
0	0	Timer output	TMO ₀	Output	Compare match output
		Timer clock input	TCLKC	Input	Counter external clock input
	1	Timer input/output	TMIO ₁	I/O	Compare match output/input capture input
		Timer clock input	TCLKA	Input	Counter external clock input
1	2	Timer output	TMO ₂	Output	Compare match output
		Timer clock input	TCLKD	Input	Counter external clock input
	3	Timer input/output	TMIO ₃	I/O	Compare match output/input capture input
		Timer clock input	TCLKB	Input	Counter external clock input

9.1.4 Register Configuration

Table 9.2 summarizes the registers of the 8-bit timer module.

Table 9.2 8-Bit Timer Registers

Channel	Address ^{*1}	Name	Abbreviation	R/W	Initial value
0	H'FFF80	Timer control register 0	8TCR0	R/W	H'00
	H'FFF82	Timer control/status register 0	8TCSR0	R/(W) ^{*2}	H'00
	H'FFF84	Time constant register A0	TCORA0	R/W	H'FF
	H'FFF86	Time constant register B0	TCORB0	R/W	H'FF
	H'FFF88	Timer counter 0	8TCNT0	R/W	H'00
1	H'FFF81	Timer control register 1	8TCR1	R/W	H'00
	H'FFF83	Timer control/status register 1	8TCSR1	R/(W) ^{*2}	H'00
	H'FFF85	Time constant register A1	TCORA1	R/W	H'FF
	H'FFF87	Time constant register B1	TCORB1	R/W	H'FF
	H'FFF89	Timer counter 1	8TCNT1	R/W	H'00
2	H'FFF90	Timer control register 2	8TCR2	R/W	H'00
	H'FFF92	Timer control/status register 2	8TCSR2	R/(W) ^{*2}	H'10
	H'FFF94	Time constant register A2	TCORA2	R/W	H'FF
	H'FFF96	Time constant register B2	TCORB2	R/W	H'FF
	H'FFF98	Timer counter 2	8TCNT2	R/W	H'00
3	H'FFF91	Timer control register 3	8TCR3	R/W	H'00
	H'FFF93	Timer control/status register 3	8TCSR3	R/(W) ^{*2}	H'00
	H'FFF95	Time constant register A3	TCORA3	R/W	H'FF
	H'FFF97	Time constant register B3	TCORB3	R/W	H'FF
	H'FFF99	Timer counter 3	8TCNT3	R/W	H'00

Notes: 1. Indicates the lower 20 bits of the address in advanced mode.

2. Only 0 can be written to bits 7 to 5, to clear these flags.

Each pair of registers for channel 0 and channel 1 comprises a 16-bit register with the channel 0 register as the upper 8 bits and the channel 1 register as the lower 8 bits, so they can be accessed together by word access.

Similarly, each pair of registers for channel 2 and channel 3 comprises a 16-bit register with the channel 2 register as the upper 8 bits and the channel 3 register as the lower 8 bits, so they can be accessed together by word access.

9.2 Register Descriptions

9.2.1 Timer Counters (8TCNT)

8TCNT0								8TCNT1								
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

8TCNT2								8TCNT3								
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The timer counters (8TCNT) are 8-bit readable/writable up-counters that increment on pulses generated from an internal or external clock source. The clock source is selected by clock select bits 2 to 0 (CKS2 to CKS0) in the timer control register (8TCR). The CPU can always read or write to the timer counters.

The 8TCNT0 and 8TCNT1 pair, and the 8TCNT2 and 8TCNT3 pair, can each be accessed as a 16-bit register by word access.

8TCNT can be cleared by an input capture signal or compare match signal. Counter clear bits 1 and 0 (CCLR1 and CCLR0) in 8TCR select the method of clearing.

When 8TCNT overflows from H'FF to H'00, the overflow flag (OVF) in the timer control/status register (8TCSR) is set to 1.

Each 8TCNT is initialized to H'00 by a reset and in standby mode.

9.2.2 Time Constant Registers A (TCORA)

TCORA0 to TCORA3 are 8-bit readable/writable registers.

The TCORA0 and TCORA1 pair, and the TCORA2 and TCORA3 pair, can each be accessed as a 16-bit register by word access.

The TCORA value is constantly compared with the 8TCNT value. When a match is detected, the corresponding compare match flag A (CMFA) is set to 1 in 8TCSR.

The timer output can be freely controlled by these compare match signals and the settings of output select bits 1 and 0 (OS1, OS0) in 8TCSR.

Each TCORA register is initialized to H'FF by a reset and in standby mode.

9.2.3 Time Constant Registers B (TCORB)

TCORB0 to TCORB3 are 8-bit readable/writable registers. The TCORB0 and TCORB1 pair, and the TCORB2 and TCORB3 pair, can each be accessed as a 16-bit register by word access.

The TCORB value is constantly compared with the 8TCNT value. When a match is detected, the corresponding compare match flag B (CMFB) is set to 1 in 8TCSR*.

The timer output can be freely controlled by these compare match signals and the settings of output/input capture edge select bits 3 and 2 (OIS3, OIS2) in 8TCSR.

When TCORB is used for input capture, it stores the 8TCNT value on detection of an external input capture signal. At this time, the CMFB flag is set to 1 in the corresponding 8TCSR register. The detected edge of the input capture signal is set in 8TCSR.

Each TCORB register is initialized to H'FF by a reset and in standby mode.

Note: * When channel 1 and channel 3 are designated for TCORB input capture, the CMFB flag is not set by a channel 0 or channel 2 compare match B.

9.2.4 Timer Control Register (8TCR)

Bit	7	6	5	4	3	2	1	0
	CMIEB	CMIEA	OVIE	CCLR1	CCLR0	CKS2	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

8TCR is an 8-bit readable/writable register that selects the 8TCNT input clock, gives the 8TCNT clearing specification, and enables interrupt requests.

8TCR is initialized to H'00 by a reset and in standby mode.

For the timing, see section 9.4, Operation.

Bit 7—Compare Match Interrupt Enable B (CMIEB): Enables or disables the CMIB interrupt request when the CMFB flag is set to 1 in 8TCSR.

Bit 7

CMIEB	Description
0	CMIB interrupt requested by CMFB is disabled (Initial value)
1	CMIB interrupt requested by CMFB is enabled

Bit 6—Compare Match Interrupt Enable A (CMIEA): Enables or disables the CMIA interrupt request when the CMFA flag is set to 1 in 8TCSR.

Bit 6

CMIEA	Description
0	CMIA interrupt requested by CMFA is disabled (Initial value)
1	CMIA interrupt requested by CMFA is enabled

Bit 5—Timer Overflow Interrupt Enable (OVIE): Enables or disables the OVI interrupt request when the OVF flag is set to 1 in 8TCSR.

Bit 5

OVIE	Description
0	OVI interrupt requested by OVF is disabled (Initial value)
1	OVI interrupt requested by OVF is enabled

Bits 4 and 3—Counter Clear 1 and 0 (CCLR1, CCLR0): These bits specify the 8TCNT clearing source. Compare match A or B, or input capture B, can be selected as the clearing source.

Bit 4 CCLR1	Bit 3 CCLR0	Description	
0	0	Clearing is disabled	(Initial value)
	1	Cleared by compare match A	
1	0	Cleared by compare match B/input capture B	
	1	Cleared by input capture B	

Note: When input capture B is set as the 8TCNT1 and 8TCNT3 counter clear source, 8TCNT0 and 8TCNT2 are not cleared by compare match B.

Bits 2 to 0—Clock Select 2 to 0 (CSK2 to CSK0): These bits select whether the clock input to 8TCNT is an internal or external clock.

Three internal clocks can be selected, all divided from the system clock (ϕ): $\phi/8$, $\phi/64$, and $\phi/8192$. The rising edge of the selected internal clock triggers the count.

When use of an external clock is selected, three types of count can be selected: at the rising edge, the falling edge, and both rising and falling edges.

When $CKS2$, $CKS1$, $CKS0 = 1, 0, 0$, channels 0 and 1 and channels 2 and 3 are cascaded.

The incrementing clock source is different when 8TCR0 and 8TCR2 are set, and when 8TCR1 and 8TCR3 are set.

Bit 2 CSK2	Bit 1 CSK1	Bit 0 CSK0	Description	
0	0	0	Clock input disabled (Initial value)	
		1	Internal clock, counted on falling edge of $\phi/8$	
	1	0	Internal clock, counted on falling edge of $\phi/64$	
		1	Internal clock, counted on falling edge of $\phi/8192$	
1	0	0	Channel 0 (16-bit count mode): Count on 8TCNT1 overflow signal ^{*1} Channel 1 (compare match count mode): Count on 8TCNT0 compare match A ^{*1} Channel 2 (16-bit count mode): Count on 8TCNT3 overflow signal ^{*2} Channel 3 (compare match count mode): Count on 8TCNT2 compare match A ^{*2}	
		1	External clock, counted on rising edge	
		1	0	External clock, counted on falling edge
			1	External clock, counted on both rising and falling edges

- Notes:
1. If the clock input of channel 0 is the 8TCNT1 overflow signal and that of channel 1 is the 8TCNT0 compare match signal, no incrementing clock is generated. Do not use this setting.
 2. If the clock input of channel 2 is the 8TCNT3 overflow signal and that of channel 3 is the 8TCNT2 compare match signal, no incrementing clock is generated. Do not use this setting.

9.2.5 Timer Control/Status Registers (8TCSR)

8TCSR0

Bit	7	6	5	4	3	2	1	0
	CMFB	CMFA	OVF	ADTE	OIS3	OIS2	OS1	OS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/W	R/W	R/W	R/W	R/W

8TCSR2

Bit	7	6	5	4	3	2	1	0
	CMFB	CMFA	OVF	—	OIS3	OIS2	OS1	OS0
Initial value	0	0	0	1	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	—	R/W	R/W	R/W	R/W

8TCSR1, 8TCSR3

Bit	7	6	5	4	3	2	1	0
	CMFB	CMFA	OVF	ICE	OIS3	OIS2	OS1	OS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/W	R/W	R/W	R/W	R/W

Note: * Only 0 can be written to bits 7 to 5, to clear these flags.

The timer control/status registers 8TCSR are 8-bit registers that indicate compare match/input capture and overflow statuses, and control compare match output/input capture edge selection.

8TCSR2 is initialized to H'10, and 8TCSR0, 8TCSR1, and 8TCSR3 to H'00, by a reset and in standby mode.

Bit 7—Compare Match/Input Capture Flag B (CMFB): Status flag that indicates the occurrence of a TCORB compare match or input capture.

Bit 7 CMFB	Description
0	[Clearing condition] (Initial value) Read CMFB when CMFB = 1, then write 0 in CMFB
1	[Setting conditions] <ul style="list-style-type: none"> • 8TCNT = TCORB* • The 8TCNT value is transferred to TCORB by an input capture signal when TCORB functions as an input capture register

Note: *When bit ICE is set to 1 in 8TCSR1 and 8TCSR3, the CMFB flag is not set when 8TCNT0 = TCORB0 or 8TCNT2 = TCORB2.

Bit 6—Compare Match Flag A (CMFA): Status flag that indicates the occurrence of a TCORA compare match.

Bit 6 CMFA	Description
0	[Clearing condition] (Initial value) Read CMFA when CMFA = 1, then write 0 in CMFA
1	[Setting condition] 8TCNT = TCORA

Bit 5—Timer Overflow Flag (OVF): Status flag that indicates that the 8TCNT has overflowed from H'FF to H'00.

Bit 5 OVF	Description
0	[Clearing condition] (Initial value) Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition] 8TCNT overflows from H'FF to H'00

Bit 4—A/D Trigger Enable (ADTE) (In 8TCSR0): In combination with TRGE in the A/D control register (ADCR), enables or disables A/D converter start requests by compare match A or an external trigger.

TRGE*	Bit 4 ADTE	Description
0	0	A/D converter start requests by compare match A or external trigger pin ($\overline{\text{ADTRG}}$) input are disabled (Initial value)
	1	A/D converter start requests by compare match A or external trigger pin ($\overline{\text{ADTRG}}$) input are disabled
1	0	A/D converter start requests by external trigger pin ($\overline{\text{ADTRG}}$) input are enabled, and A/D converter start requests by compare match A are disabled
	1	A/D converter start requests by compare match A are enabled, and A/D converter start requests by external trigger pin ($\overline{\text{ADTRG}}$) input are disabled

Note: * TRGE is bit 7 of the A/D control register (ADCR).

Bit 4—Reserved (In 8TCSR2): This bit is a reserved bit, but can be read and written.

Bit 4—Input Capture Enable (ICE) (In 8TCSR1 and 8TCSR3): Selects the function of TCORB1 and TCORB3.

Bit 4 ICE	Description
0	TCORB1 and TCORB3 are compare match registers (Initial value)
1	TCORB1 and TCORB3 are input capture registers

When bit ICE is set to 1 in 8TCSR1 or 8TCSR3, the operation of the TCORA and TCORB registers in channels 0 to 3 is as shown in the tables below.

Table 9.3 Operation of Channels 0 and 1 when Bit ICE is Set to 1 in 8TCSR1 Register

Register	Register Function	Status Flag Change	Timer Output Capture Input	Interrupt Request
TCORA0	Compare match operation	CMFA changed from 0 to 1 in 8TCSR0 by compare match	TMO ₀ output controllable	CMIA0 interrupt request generated by compare match
TCORB0	Compare match operation	CMFB not changed from 0 to 1 in 8TCSR0 by compare match	No output from TMO ₀	CMIB0 interrupt request not generated by compare match
TCORA1	Compare match operation	CMFA changed from 0 to 1 in 8TCSR1 by compare match	TMIO ₁ is dedicated input capture pin	CMIA1 interrupt request generated by compare match
TCORB1	Input capture operation	CMFB changed from 0 to 1 in 8TCSR1 by input capture	TMIO ₁ is dedicated input capture pin	CMIB1 interrupt request generated by input capture

Table 9.4 Operation of Channels 2 and 3 when Bit ICE is Set to 1 in 8TCSR3 Register

Register	Register Function	Status Flag Change	Timer Output Capture Input	Interrupt Request
TCORA2	Compare match operation	CMFA changed from 0 to 1 in 8TCSR2 by compare match	TMO ₂ output controllable	CMIA2 interrupt request generated by compare match
TCORB2	Compare match operation	CMFB not changed from 0 to 1 in 8TCSR2 by compare match	No output from TMO ₂	CMIB2 interrupt request not generated by compare match
TCORA3	Compare match operation	CMFA changed from 0 to 1 in 8TCSR3 by compare match	TMIO ₃ is dedicated input capture pin	CMIA3 interrupt request generated by compare match
TCORB3	Input capture operation	CMFB changed from 0 to 1 in 8TCSR3 by input capture	TMIO ₃ is dedicated input capture pin	CMIB3 interrupt request generated by input capture

Bits 3 and 2—Output/Input Capture Edge Select B3 and B2 (OIS3, OIS2): In combination with the ICE bit in 8TCSR1 (8TCSR3), these bits select the compare match B output level or the input capture input detected edge.

The function of TCORB1 (TCORB3) depends on the setting of bit 4 of 8TCSR1 (8TCSR3).

ICE Bit in 8TCSR1 (8TCSR3)	Bit 3 OIS3	Bit 2 OIS2	Description
0	0	0	No change when compare match B occurs (Initial value)
		1	0 is output when compare match B occurs
	1	0	1 is output when compare match B occurs
		1	Output is inverted when compare match B occurs (toggle output)
1	0	0	TCORB input capture on rising edge
		1	TCORB input capture on falling edge
	1	0	TCORB input capture on both rising and falling edges
		1	

- When the compare match register function is used, the timer output priority order is: toggle output > 1 output > 0 output.
- If compare match A and B occur simultaneously, the output changes in accordance with the higher-priority compare match.
- When bits OIS3, OIS2, OS1, and OS0 are all cleared to 0, timer output is disabled.

Bits 1 and 0—Output Select A1 and A0 (OS1, OS0): These bits select the compare match A output level.

Bit 1 OS1	Bit 0 OS0	Description
0	0	No change when compare match A occurs (Initial value)
	1	0 is output when compare match A occurs
1	0	1 is output when compare match A occurs
	1	Output is inverted when compare match A occurs (toggle output)

- When the compare match register function is used, the timer output priority order is: toggle output > 1 output > 0 output.
- If compare match A and B occur simultaneously, the output changes in accordance with the higher-priority compare match.
- When bits OIS3, OIS2, OS1, and OS0 are all cleared to 0, timer output is disabled.

9.3 CPU Interface

9.3.1 8-Bit Registers

8TCNT, TCORA, TCORB, 8TCR, and 8TCSR are 8-bit registers. These registers are connected to the CPU by an internal 16-bit data bus and can be read and written a word at a time or a byte at a time.

Figures 9.2 and 9.3 show the operation in word read and write accesses to 8TCNT.

Figures 9.4 to 9.7 show the operation in byte read and write accesses to 8TCNT0 and 8TCNT1.

Figure 9.2 8TCNT Access Operation (CPU Writes to 8TCNT, Word)

Figure 9.3 8TCNT Access Operation (CPU Reads 8TCNT, Word)

Figure 9.4 8TCNT0 Access Operation (CPU Writes to 8TCNT0, Upper Byte)

Figure 9.5 8TCNT1 Access Operation (CPU Writes to 8TCNT1, Lower Byte)

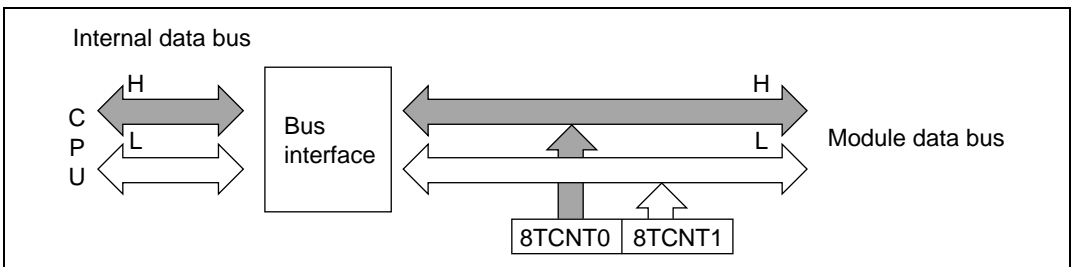

Figure 9.6 8TCNT0 Access Operation (CPU Reads 8TCNT0, Upper Byte)

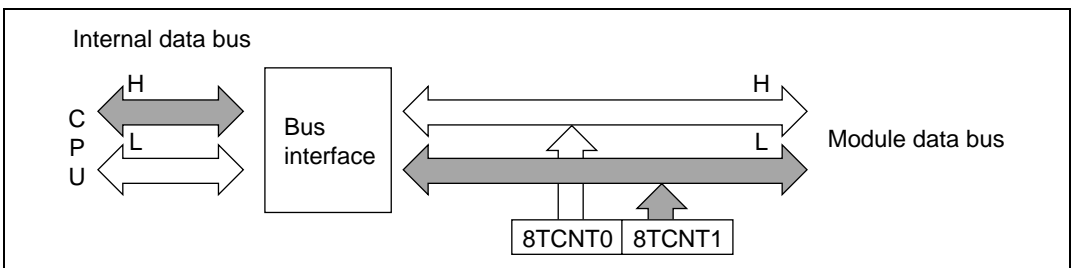

Figure 9.7 8TCNT1 Access Operation (CPU Reads 8TCNT1, Lower Byte)

9.4 Operation

9.4.1 8TCNT Count Timing

8TCNT is incremented by input clock pulses (either internal or external).

Internal Clock: Three different internal clock signals ($\phi/8$, $\phi/64$, or $\phi/8192$) divided from the system clock (ϕ) can be selected, by setting bits CKS2 to CKS0 in 8TCR. Figure 9.8 shows the count timing.

Figure 9.8 Count Timing for Internal Clock Input

External Clock: Three incrementation methods can be selected by setting bits CKS2 to CKS0 in 8TCR: on the rising edge, the falling edge, and both rising and falling edges.

The pulse width of the external clock signal must be at least 1.5 system clocks when a single edge is selected, and at least 2.5 system clocks when both edges are selected. Shorter pulses will not be counted correctly.

Figure 9.9 shows the timing for incrementation on both edges of the external clock signal.

Figure 9.9 Count Timing for External Clock Input (Both-Edge Detection)

9.4.2 Compare Match Timing

Timer Output Timing: When compare match A or B occurs, the timer output is as specified by the OIS3, OIS2, OS1, and OS0 bits in 8TCSR (unchanged, 0 output, 1 output, or toggle output).

Figure 9.10 shows the timing when the output is set to toggle on compare match A.

Figure 9.10 Timing of Timer Output

Clear by Compare Match: Depending on the setting of the CCLR1 and CCLR0 bits in 8TCR, 8TCNT can be cleared when compare match A or B occurs, Figure 9.11 shows the timing of this operation.

Figure 9.11 Timing of Clear by Compare Match

Clear by Input Capture: Depending on the setting of the CCLR1 and CCLR0 bits in 8TCR, 8TCNT can be cleared when input capture B occurs. Figure 9.12 shows the timing of this operation.

Figure 9.12 Timing of Clear by Input Capture

9.4.3 Input Capture Signal Timing

Input capture on the rising edge, falling edge, or both edges can be selected by settings in 8TCSR.

Figure 9.13 shows the timing when the rising edge is selected.

The pulse width of the input capture input signal must be at least 1.5 system clocks when a single edge is selected, and at least 2.5 system clocks when both edges are selected.

Figure 9.13 Timing of Input Capture Input Signal

9.4.4 Timing of Status Flag Setting

Timing of CMFA/CMFB Flag Setting when Compare Match Occurs: The CMFA and CMFB flags in 8TCSR are set to 1 by the compare match signal output when the TCORA or TCORB and 8TCNT values match. The compare match signal is generated in the last state of the match (when the matched 8TCNT count value is updated). Therefore, after the 8TCNT and TCORA or TCORB values match, the compare match signal is not generated until an incrementing clock pulse signal is generated. Figure 9.14 shows the timing in this case.

Figure 9.14 CMF Flag Setting Timing when Compare Match Occurs

Timing of CMFB Flag Setting when Input Capture Occurs: On generation of an input capture signal, the CMFB flag is set to 1 and at the same time the 8TCNT value is transferred to TCORB. Figure 9.15 shows the timing in this case.

Figure 9.15 CMFB Flag Setting Timing when Input Capture Occurs

Timing of Overflow Flag (OVF) Setting: The OVF flag in 8TCSR is set to 1 by the overflow signal generated when 8TCNT overflows (from H'FF to H'00). Figure 9.16 shows the timing in this case.

Figure 9.16 Timing of OVF Setting

9.4.5 Operation with Cascaded Connection

If bits CKS2 to CKS0 are set to (100) in either 8TCR0 or 8TCR1, the 8-bit timers of channels 0 and 1 are cascaded. With this configuration, the two timers can be used as a single 16-bit timer (16-bit timer mode), or channel 0 8-bit timer compare matches can be counted in channel 1 (compare match count mode). Similarly, if bits CKS2 to CKS0 are set to (100) in either 8TCR2 or 8TCR3, the 8-bit timers of channels 2 and 3 are cascaded. With this configuration, the two timers can be used as a single 16-bit timer (16-bit timer mode), or channel 2 8-bit timer compare matches can be counted in channel 3 (compare match count mode). In this case, the timer operates as below.

16-Bit Count Mode

- Channels 0 and 1

When bits CKS2 to CKS0 are set to (100) in 8TCR0, the timer functions as a single 16-bit timer with channel 0 occupying the upper 8 bits and channel 1 occupying the lower 8 bits.

— Setting when Compare Match Occurs

- The CMFA or CMFB flag is set to 1 in 8TCSR0 when a 16-bit compare match occurs.
- The CMFA or CMFB flag is set to 1 in 8TCSR1 when a lower 8-bit compare match occurs.
- TMO₀ pin output control by bits OIS3, OIS2, OS1, and OS0 in 8TCSR0 is in accordance with the 16-bit compare match conditions.
- TMIO₁ pin output control by bits OIS3, OIS2, OS1, and OS0 in 8TCSR1 is in accordance with the lower 8-bit compare match conditions.

— Setting when Input Capture Occurs

- The CMFB flag is set to 1 in 8TCSR0 and 8TCSR1 when the ICE bit is 1 in TCSR1 and input capture occurs.
- TMIO₁ pin input capture input signal edge detection is selected by bits OIS3 and OIS2 in 8TCSR0.

— Counter Clear Specification

- If counter clear on compare match or input capture has been selected by the CCLR1 and CCLR0 bits in 8TCR0, the 16-bit counter (both 8TCNT0 and 8TCNT1) is cleared.
- The settings of the CCLR1 and CCLR0 bits in 8TCR1 are ignored. The lower 8 bits cannot be cleared independently.

— OVF Flag Operation

- The OVF flag is set to 1 in 8TCSR0 when the 16-bit counter (8TCNT0 and 8TCNT1) overflows (from H'FFFF to H'0000).
- The OVF flag is set to 1 in 8TCSR1 when the 8-bit counter (8TCNT1) overflows (from H'FF to H'00).

- Channels 2 and 3

When bits CKS2 to CKS0 are set to (100) in 8TCR2, the timer functions as a single 16-bit timer with channel 2 occupying the upper 8 bits and channel 3 occupying the lower 8 bits.

— Setting when Compare Match Occurs

- The CMFA or CMFB flag is set to 1 in 8TCSR2 when a 16-bit compare match occurs.
- The CMFA or CMFB flag is set to 1 in 8TCSR3 when a lower 8-bit compare match occurs.
- TMO₂ pin output control by bits OIS3, OIS2, OS1, and OS0 in 8TCSR2 is in accordance with the 16-bit compare match conditions.
- TMIO₃ pin output control by bits OIS3, OIS2, OS1, and OS0 in 8TCSR3 is in accordance with the lower 8-bit compare match conditions.

— Setting when Input Capture Occurs

- The CMFB flag is set to 1 in 8TCSR2 and 8TCSR3 when the ICE bit is 1 in TCSR3 and input capture occurs.
- TMIO₃ pin input capture input signal edge detection is selected by bits OIS3 and OIS2 in 8TCSR2.

— Counter Clear Specification

- If counter clear on compare match has been selected by the CCLR1 and CCLR0 bits in 8TCR2, the 16-bit counter (both 8TCNT2 and 8TCNT3) is cleared.
- The settings of the CCLR1 and CCLR0 bits in 8TCR3 are ignored. The lower 8 bits cannot be cleared independently.

— OVF Flag Operation

- The OVF flag is set to 1 in 8TCSR2 when the 16-bit counter (8TCNT2 and 8TCNT3) overflows (from H'FFFF to H'0000).
- The OVF flag is set to 1 in 8TCSR3 when the 8-bit counter (8TCNT3) overflows (from H'FF to H'00).

Compare Match Count Mode

- Channels 0 and 1

When bits CKS2 to CKS0 are set to (100) in 8TCR1, 8TCNT1 counts channel 0 compare match A events.

CMF flag setting, interrupt generation, TMO pin output, counter clearing, and so on, is in accordance with the settings for each channel.

Note: When bit ICE = 1 in 8TCSR1, the compare match register function of TCORB0 in channel 0 cannot be used.

- Channels 2 and 3

When bits CKS2 to CKS0 are set to (100) in 8TCR3, 8TCNT3 counts channel 2 compare match A events.

CMF flag setting, interrupt generation, TMO pin output, counter clearing, and so on, is in accordance with the settings for each channel.

Note: When bit ICE = 1 in 8TCSR3, the compare match register function of TCORB2 in channel 2 cannot be used.

Caution

Do not set 16-bit counter mode and compare match count mode simultaneously within the same group, as the 8TCNT input clock will not be generated and the counters will not operate.

9.4.6 Input Capture Setting

The 8TCNT value can be transferred to TCORB on detection of an input edge on the input capture/output compare pin (TMIO₁ or TMIO₃). Rising edge, falling edge, or both edge detection can be selected. In 16-bit count mode, 16-bit input capture can be used.

Setting Input Capture Operation in 8-Bit Timer Mode (Normal Operation)

- Channel 1

- Set TCORB1 as an 8-bit input capture register with the ICE bit in 8TCSR1.

- Select rising edge, falling edge, or both edges as the input edge(s) for the input capture signal (TMIO₁) with bits OIS3 and OIS2 in 8TCSR1.

- Select the input clock with bits CKS2 to CKS0 in 8TCR1, and start the 8TCNT count.

- Channel 3
 - Set TCORB3 as an 8-bit input capture register with the ICE bit in 8TCSR3.
 - Select rising edge, falling edge, or both edges as the input edge(s) for the input capture signal (TMIO₃) with bits OIS3 and OIS2 in 8TCSR3.
 - Select the input clock with bits CKS2 to CKS0 in 8TCR3, and start the 8TCNT count.

Note: When TCORB1 in channel 1 is used for input capture, TCORB0 in channel 0 cannot be used as a compare match register.
Similarly, when TCORB3 in channel 3 is used for input capture, TCORB2 in channel 2 cannot be used as a compare match register.

Setting Input Capture Operation in 16-Bit Count Mode

- Channels 0 and 1
 - In 16-bit count mode, TCORB0 and TCORB1 function as a 16-bit input capture register when the ICE bit is set to 1 in 8TCSR1.
 - Select rising edge, falling edge, or both edges as the input edge(s) for the input capture signal (TMIO₁) with bits OIS3 and OIS2 in 8TCSR0. (In 16-bit count mode, the settings of bits OIS3 and OIS2 in 8TCSR1 are ignored.)
 - Select the input clock with bits CKS2 to CKS0 in 8TCR1, and start the 8TCNT count.
- Channels 2 and 3
 - In 16-bit count mode, TCORB2 and TCORB3 function as a 16-bit input capture register when the ICE bit is set to 1 in 8TCSR3.
 - Select rising edge, falling edge, or both edges as the input edge(s) for the input capture signal (TMIO₃) with bits OIS3 and OIS2 in 8TCSR2. (In 16-bit count mode, the settings of bits OIS3 and OIS2 in 8TCSR3 are ignored.)
 - Select the input clock with bits CKS2 to CKS0 in 8TCR3, and start the 8TCNT count.

9.5 Interrupt

9.5.1 Interrupt Sources

The 8-bit timer unit can generate three types of interrupt: compare match A and B (CMIA and CMIB) and overflow (TOVI). Table 9.5 shows the interrupt sources and their priority order. Each interrupt source is enabled or disabled by the corresponding interrupt enable bit in 8TCR. A separate interrupt request signal is sent to the interrupt controller by each interrupt source.

Table 9.5 Types of 8-Bit Timer Interrupt Sources and Priority Order

Interrupt Source	Description	Priority
CMIA	Interrupt by CMFA	High
CMIB	Interrupt by CMFB	↑
TOVI	Interrupt by OVF	Low

For compare match interrupts CMIA1/CMIB1 and CMIA3/CMIB3 and the overflow interrupts (TOVI0/TOVI1 and TOVI2/TOVI3), one vector is shared by two interrupts.

Table 9.6 lists the interrupt sources.

Table 9.6 8-Bit Timer Interrupt Sources

Channel	Interrupt Source	Description
0	CMIA0	TCORA0 compare match
	CMIB0	TCORB0 compare match/input capture
1	CMIA1/CMIB1	TCORA1 compare match, or TCORB1 compare match/input capture
0, 1	TOVI0/TOVI1	Counter 0 or counter 1 overflow
2	CMIA2	TCORA2 compare match
	CMIB2	TCORB2 compare match/input capture
3	CMIA3/CMIB3	TCORA3 compare match, or TCORB3 compare match/input capture
2, 3	TOVI2/TOVI3	Counter 2 or counter 3 overflow

9.5.2 A/D Converter Activation

The A/D converter can only be activated by channel 0 compare match A.

If the ADTE bit setting is 1 when the CMFA flag in 8TCSR0 is set to 1 by generation of channel 0 compare match A, an A/D conversion start request will be issued to the A/D converter. If the TRGE bit in ADCR is 1 at this time, the A/D converter will be started. If the ADTE bit in 8TCSR0 is 1, A/D converter external trigger pin (\overline{ADTRG}) input is disabled.

9.6 8-Bit Timer Application Example

Figure 9.17 shows how the 8-bit timer module can be used to output pulses with any desired duty cycle. The settings for this example are as follows:

- Clear the CCLR1 bit to 0 and set the CCLR0 bit to 1 in 8TCR so that 8TCNT is cleared by a TCORA compare match.
- Set bits OIS3, OIS2, OS1, and OS0 to (0110) in 8TCSR so that 1 is output on a TCORA compare match and 0 is output on a TCORB compare match.

The above settings enable a waveform with the cycle determined by TCORA and the pulse width detected by TCORB to be output without software intervention.

Figure 9.17 Example of Pulse Output

9.7 Usage Notes

Note that the following kinds of contention can occur in 8-bit timer operation.

9.7.1 Contention between 8TCNT Write and Clear

If a timer counter clear signal occurs in the T_3 state of a 8TCNT write cycle, clearing of the counter takes priority and the write is not performed. Figure 9.18 shows the timing in this case.

Figure 9.18 Contention between 8TCNT Write and Clear

9.7.2 Contention between 8TCNT Write and Increment

If an increment pulse occurs in the T_3 state of a 8TCNT write cycle, writing takes priority and 8TCNT is not incremented. Figure 9.19 shows the timing in this case.

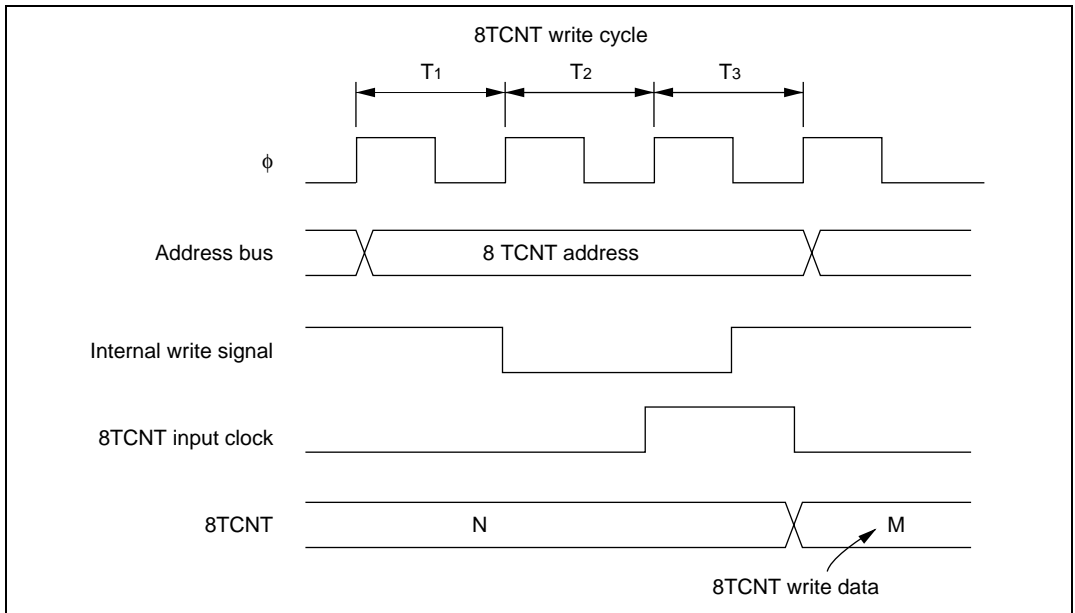

Figure 9.19 Contention between 8TCNT Write and Increment

9.7.3 Contention between TCOR Write and Compare Match

If a compare match occurs in the T_3 state of a TCOR write cycle, writing takes priority and the compare match signal is inhibited. Figure 9.20 shows the timing in this case.

Figure 9.20 Contention between TCOR Write and Compare Match

9.7.4 Contention between TCOR Read and Input Capture

If an input capture signal occurs in the T_3 state of a TCOR read cycle, the value before input capture is read. Figure 9.21 shows the timing in this case.

Figure 9.21 Contention between TCOR Read and Input Capture

9.7.5 Contention between Counter Clearing by Input Capture and Counter Increment

If an input capture signal and counter increment signal occur simultaneously, counter clearing by the input capture signal takes priority and the counter is not incremented. The value before the counter is cleared is transferred to TCORB. Figure 9.22 shows the timing in this case.

Figure 9.22 Contention between Counter Clearing by Input Capture and Counter Increment

9.7.6 Contention between TCOR Write and Input Capture

If an input capture signal occurs in the T_3 state of a TCOR write cycle, input capture takes priority and the write to TCOR is not performed. Figure 9.23 shows the timing in this case.

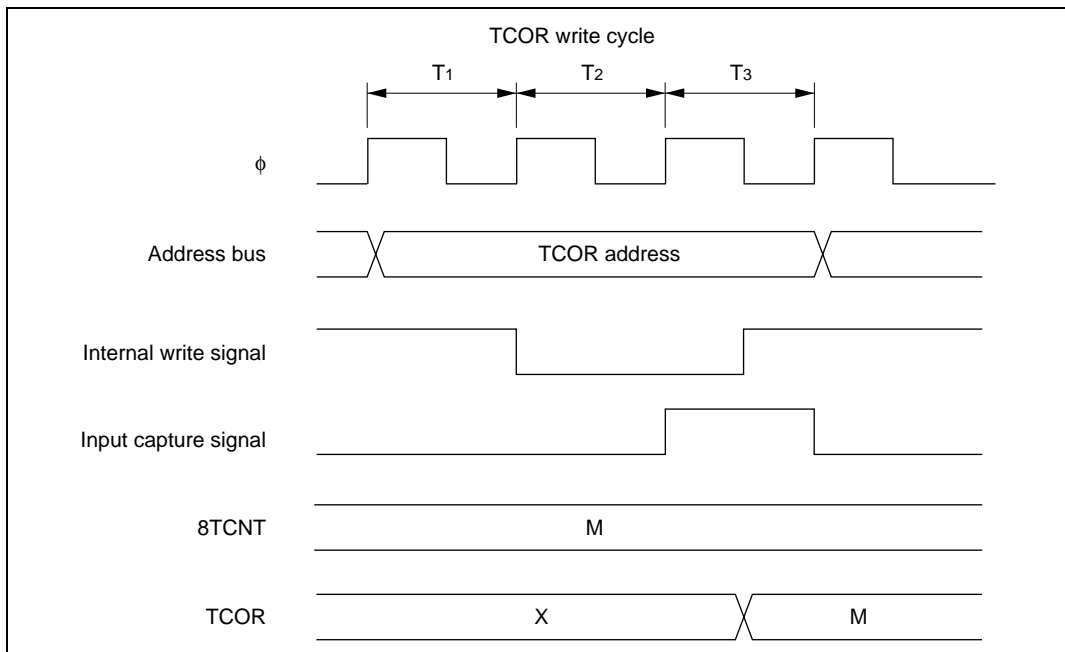

Figure 9.23 Contention between TCOR Write and Input Capture

9.7.7 Contention between 8TCNT Byte Write and Increment in 16-Bit Count Mode (Cascaded Connection)

If an increment pulse occurs in the T_3 state of an 8TCNT byte write cycle in 16-bit count mode, the counter write takes priority and the byte data for which the write was performed is not incremented. The byte data for which a write was not performed is incremented. Figure 9.24 shows the timing when an increment pulse occurs in the T_2 state of a byte write to 8TCNT (upper byte). If an increment pulse occurs in the T_2 state, on the other hand, the increment takes priority.

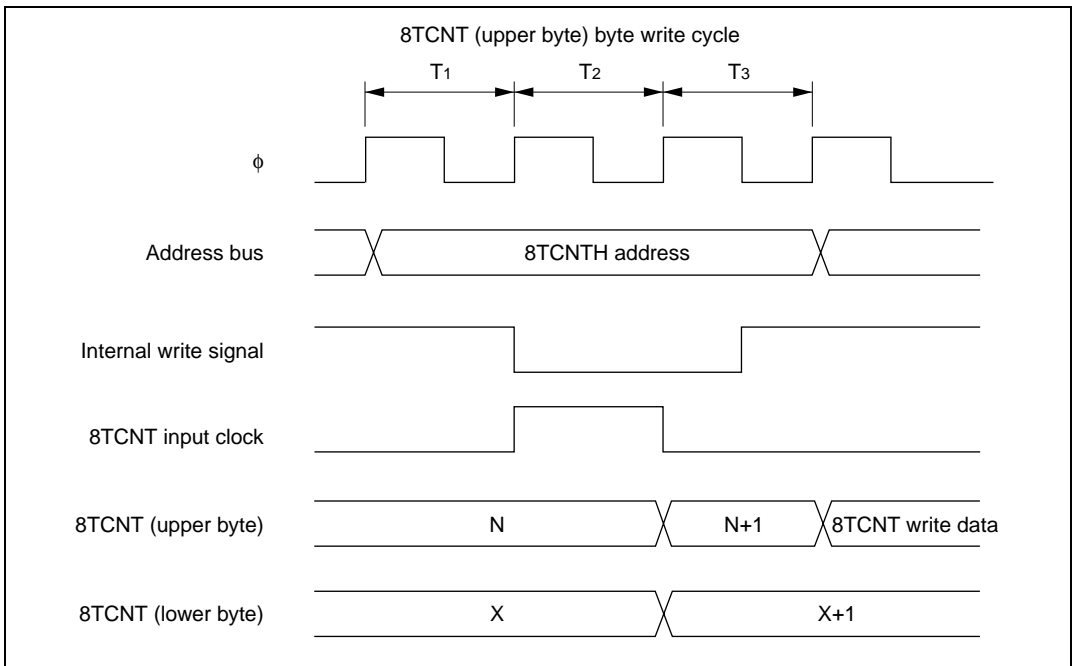

Figure 9.24 Contention between 8TCNT Byte Write and Increment in 16-Bit Count Mode

9.7.8 Contention between Compare Matches A and B

If compare matches A and B occur at the same time, the 8-bit timer operates according to the relative priority of the output states set for compare match A and compare match B, as shown in table 9.7.

Table 9.7 Timer Output Priority Order

Output Setting	Priority
Toggle output	High
1 output	↑
0 output	
No change	Low

9.7.9 8TCNT Operation and Internal Clock Source Switchover

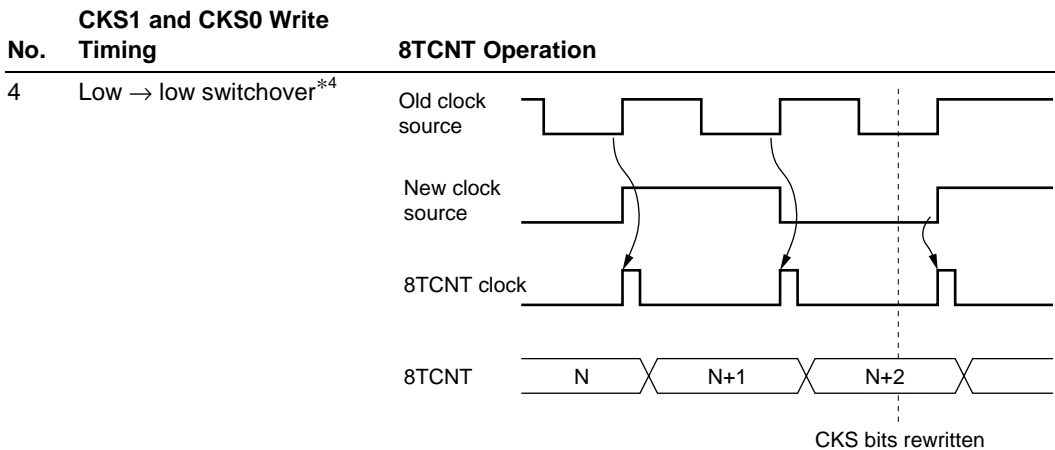

Switching internal clock sources may cause 8TCNT to increment, depending on the switchover timing. Table 9.8 shows the relation between the time of the switchover (by writing to bits CKS1 and CKS0) and the operation of 8TCNT.

The 8TCNT input clock is generated from the internal clock source by detecting the rising edge of the internal clock. If a switchover is made from a low clock source to a high clock source, as in case No. 3 in table 9.8, the switchover will be regarded as a falling edge, a 8TCNT clock pulse will be generated, and 8TCNT will be incremented.

8TCNT may also be incremented when switching between internal and external clocks.

Table 9.8 Internal Clock Switchover and 8TCNT Operation

CKS1 and CKS0 Write			
No.	Timing	8TCNT Operation	
1	High → high switchover* ¹		
2	High → low switchover* ²		
3	Low → high switchover* ³		

- Notes:
1. Including switchovers from the high level to the halted state, and from the halted state to the high level.
 2. Including switchover from the halted state to the low level.
 3. Including switchover from the low level to the halted state.
 4. The switchover is regarded as a rising edge, causing 8TCNT to increment.

Section 10 Programmable Timing Pattern Controller (TPC)

10.1 Overview

The H8/3062 Group has a built-in programmable timing pattern controller (TPC) that provides pulse outputs by using the 16-bit timer as a time base. The TPC pulse outputs are divided into 4-bit groups (group 3 to group 0) that can operate simultaneously and independently.

10.1.1 Features

TPC features are listed below.

- 16-bit output data
Maximum 16-bit data can be output. TPC output can be enabled on a bit-by-bit basis.
- Four output groups
Output trigger signals can be selected in 4-bit groups to provide up to four different 4-bit outputs.
- Selectable output trigger signals
- Output trigger signals can be selected for each group from the compare match signals of three 16-bit timer channels.
- Non-overlap mode
A non-overlap margin can be provided between pulse outputs.

10.1.2 Block Diagram

Figure 10.1 shows a block diagram of the TPC.

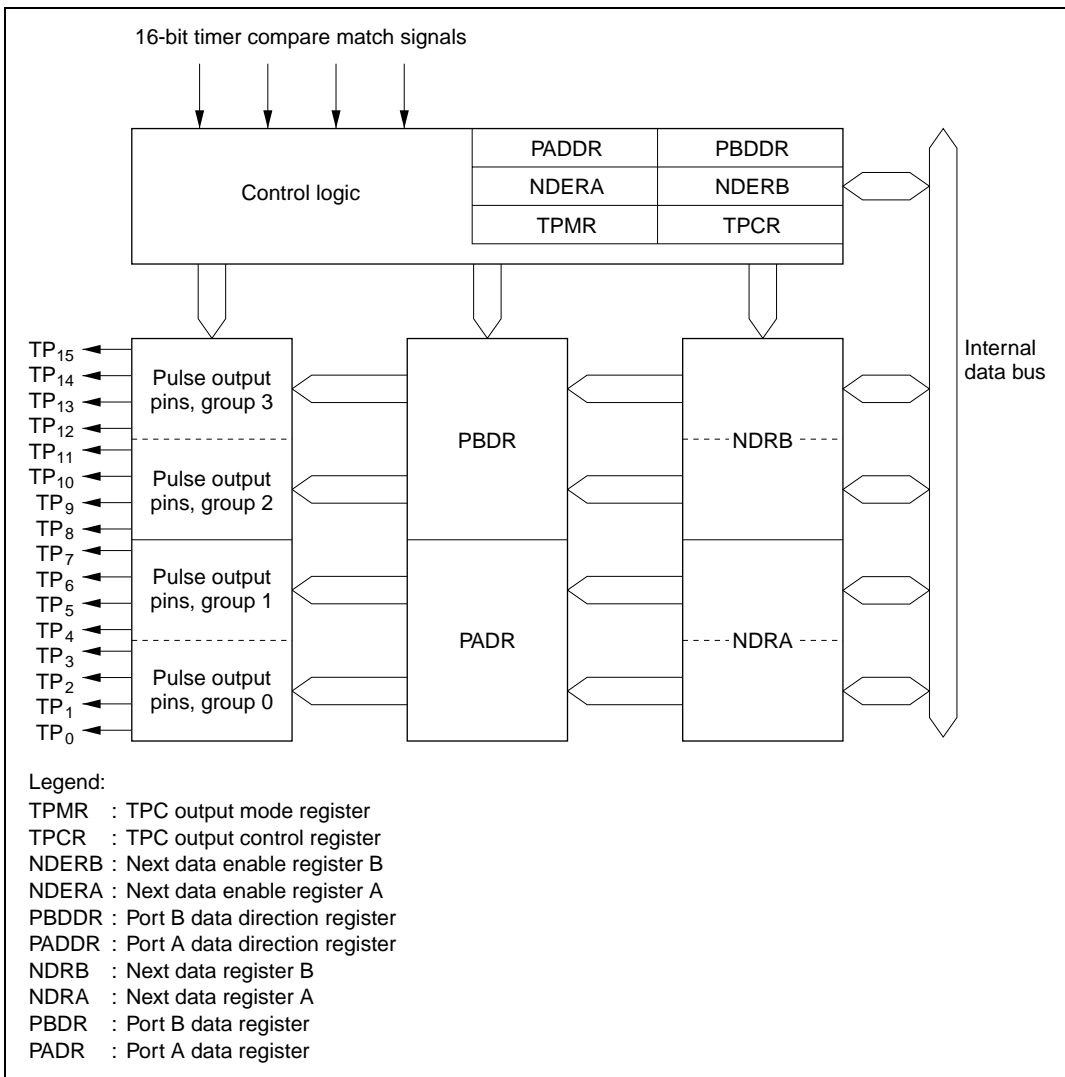

Figure 10.1 TPC Block Diagram

10.1.3 Pin Configuration

Table 10.1 summarizes the TPC output pins.

Table 10.1 TPC Pins

Name	Symbol	I/O	Function
TPC output 0	TP ₀	Output	Group 0 pulse output
TPC output 1	TP ₁	Output	
TPC output 2	TP ₂	Output	
TPC output 3	TP ₃	Output	
TPC output 4	TP ₄	Output	Group 1 pulse output
TPC output 5	TP ₅	Output	
TPC output 6	TP ₆	Output	
TPC output 7	TP ₇	Output	Group 2 pulse output
TPC output 8	TP ₈	Output	
TPC output 9	TP ₉	Output	
TPC output 10	TP ₁₀	Output	
TPC output 11	TP ₁₁	Output	Group 3 pulse output
TPC output 12	TP ₁₂	Output	
TPC output 13	TP ₁₃	Output	
TPC output 14	TP ₁₄	Output	
TPC output 15	TP ₁₅	Output	

10.1.4 Register Configuration

Table 10.2 summarizes the TPC registers.

Table 10.2 TPC Registers

Address* ¹	Name	Abbreviation	R/W	Initial Value
H'EE009	Port A data direction register	PADDR	W	H'00
H'FFFD9	Port A data register	PADR	R/(W)* ²	H'00
H'EE00A	Port B data direction register	PBDDR	W	H'00
H'FFFDA	Port B data register	PBDR	R/(W)* ²	H'00
H'FFFA0	TPC output mode register	TPMR	R/W	H'F0
H'FFFA1	TPC output control register	TPCR	R/W	H'FF
H'FFFA2	Next data enable register B	NDERB	R/W	H'00
H'FFFA3	Next data enable register A	NDERA	R/W	H'00
H'FFFA5/ H'FFFA7* ³	Next data register A	NDRA	R/W	H'00
H'FFFA4/ H'FFFA6* ³	Next data register B	NDRB	R/W	H'00

- Notes:
1. Lower 20 bits of the address in advanced mode.
 2. Bits used for TPC output cannot be written.
 3. The NDRA address is H'FFFA5 when the same output trigger is selected for TPC output groups 0 and 1 by settings in TPCR. When the output triggers are different, the NDRA address is H'FFFA7 for group 0 and H'FFFA5 for group 1. Similarly, the address of NDRB is H'FFFA4 when the same output trigger is selected for TPC output groups 2 and 3 by settings in TPCR. When the output triggers are different, the NDRB address is H'FFFA6 for group 2 and H'FFFA4 for group 3.

10.2 Register Descriptions

10.2.1 Port A Data Direction Register (PADDR)

PADDR is an 8-bit write-only register that selects input or output for each pin in port A.

Bit	7	6	5	4	3	2	1	0
	PA ₇ DDR	PA ₆ DDR	PA ₅ DDR	PA ₄ DDR	PA ₃ DDR	PA ₂ DDR	PA ₁ DDR	PA ₀ DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port A data direction 7 to 0

These bits select input or output for port A pins

Port A is multiplexed with pins TP₇ to TP₀. Bits corresponding to pins used for TPC output must be set to 1. For further information about PADDR, see section 7.11, Port A.

10.2.2 Port A Data Register (PADR)

PADR is an 8-bit readable/writable register that stores TPC output data for groups 0 and 1, when these TPC output groups are used.

Bit	7	6	5	4	3	2	1	0
	PA ₇	PA ₆	PA ₅	PA ₄	PA ₃	PA ₂	PA ₁	PA ₀
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Port A data 7 to 0

These bits store output data for TPC output groups 0 and 1

Note: * Bits selected for TPC output by NDERA settings become read-only bits.

For further information about PADR, see section 7.11, Port A.

10.2.3 Port B Data Direction Register (PBDDR)

PBDDR is an 8-bit write-only register that selects input or output for each pin in port B.

Bit	7	6	5	4	3	2	1	0
	PB ₇ DDR	PB ₆ DDR	PB ₅ DDR	PB ₄ DDR	PB ₃ DDR	PB ₂ DDR	PB ₁ DDR	PB ₀ DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B data direction 7 to 0

These bits select input or output for port B pins

Port B is multiplexed with pins TP₁₅ to TP₈. Bits corresponding to pins used for TPC output must be set to 1. For further information about PBDDR, see section 7.12, Port B.

10.2.4 Port B Data Register (PBDR)

PBDR is an 8-bit readable/writable register that stores TPC output data for groups 2 and 3, when these TPC output groups are used.

Bit	7	6	5	4	3	2	1	0
	PB ₇	PB ₆	PB ₅	PB ₄	PB ₃	PB ₂	PB ₁	PB ₀
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Port B data 7 to 0

These bits store output data for TPC output groups 2 and 3

Note: * Bits selected for TPC output by NDERB settings become read-only bits.

For further information about PBDR, see section 7.12, Port B.

10.2.5 Next Data Register A (NDRA)

NDRA is an 8-bit readable/writable register that stores the next output data for TPC output groups 1 and 0 (pins TP₇ to TP₀). During TPC output, when an 16-bit timer compare match event specified in TPCR occurs, NDRA contents are transferred to the corresponding bits in PADR. The address of NDRA differs depending on whether TPC output groups 0 and 1 have the same output trigger or different output triggers.

NDRA is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Same Trigger for TPC Output Groups 0 and 1: If TPC output groups 0 and 1 are triggered by the same compare match event, the NDRA address is H'FFFA5. The upper 4 bits belong to group 1 and the lower 4 bits to group 0. Address H'FFFA7 consists entirely of reserved bits that cannot be modified and always read 1.

Address H'FFFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	NDR3	NDR2	NDR1	NDR0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data 7 to 4	Next data 3 to 0
These bits store the next output data for TPC output group 1	These bits store the next output data for TPC output group 0

Address H'FFFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

Reserved bits

Different Triggers for TPC Output Groups 0 and 1: If TPC output groups 0 and 1 are triggered by different compare match events, the address of the upper 4 bits of NDRA (group 1) is H'FFFA5 and the address of the lower 4 bits (group 0) is H'FFFA7. Bits 3 to 0 of address H'FFFA5 and bits 7 to 4 of address H'FFFA7 are reserved bits that cannot be modified and always read 1.

Address H'FFFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Next data 7 to 4
These bits store the next output data for TPC output group 1
Reserved bits

Address H'FFFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR3	NDR2	NDR1	NDR0
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits
Next data 3 to 0
These bits store the next output data for TPC output group 0

10.2.6 Next Data Register B (NDRB)

NDRB is an 8-bit readable/writable register that stores the next output data for TPC output groups 3 and 2 (pins TP₁₅ to TP₈). During TPC output, when an 16-bit timer compare match event specified in TPCR occurs, NDRB contents are transferred to the corresponding bits in PBDR. The address of NDRB differs depending on whether TPC output groups 2 and 3 have the same output trigger or different output triggers.

NDRB is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Same Trigger for TPC Output Groups 2 and 3: If TPC output groups 2 and 3 are triggered by the same compare match event, the NDRB address is H'FFFA4. The upper 4 bits belong to group 3 and the lower 4 bits to group 2. Address H'FFFA6 consists entirely of reserved bits that cannot be modified and always read 1.

Address H'FFFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	NDR11	NDR10	NDR9	NDR8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data 15 to 12 These bits store the next output data for TPC output group 3	Next data 11 to 8 These bits store the next output data for TPC output group 2
---	--

Address H'FFFA6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

Reserved bits

Different Triggers for TPC Output Groups 2 and 3: If TPC output groups 2 and 3 are triggered by different compare match events, the address of the upper 4 bits of NDRB (group 3) is H'FFFA4 and the address of the lower 4 bits (group 2) is H'FFFA6. Bits 3 to 0 of address H'FFFA4 and bits 7 to 4 of address H'FFFA6 are reserved bits that cannot be modified and always read 1.

Address H'FFFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Next data 15 to 12
These bits store the next output data for TPC output group 3
Reserved bits

Address H'FFFA6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR11	NDR10	NDR9	NDR8
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits
Next data 11 to 8
These bits store the next output data for TPC output group 2

10.2.7 Next Data Enable Register A (NDERA)

NDERA is an 8-bit readable/writable register that enables or disables TPC output groups 1 and 0 (TP₇ to TP₀) on a bit-by-bit basis.

Bit	7	6	5	4	3	2	1	0
	NDER7	NDER6	NDER5	NDER4	NDER3	NDER2	NDER1	NDER0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 7 to 0

These bits enable or disable
TPC output groups 1 and 0

If a bit is enabled for TPC output by NDERA, then when the 16-bit timer compare match event selected in the TPC output control register (TPCR) occurs, the NDRA value is automatically transferred to the corresponding PADR bit, updating the output value. If TPC output is disabled, the bit value is not transferred from NDRA to PADR and the output value does not change.

NDERA is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Next Data Enable 7 to 0 (NDER7 to NDER0): These bits enable or disable TPC output groups 1 and 0 (TP₇ to TP₀) on a bit-by-bit basis.

Bits 7 to 0

NDER7 to NDER0	Description
0	TPC outputs TP ₇ to TP ₀ are disabled (NDR7 to NDR0 are not transferred to PA ₇ to PA ₀) (Initial value)
1	TPC outputs TP ₇ to TP ₀ are enabled (NDR7 to NDR0 are transferred to PA ₇ to PA ₀)

10.2.8 Next Data Enable Register B (NDERB)

NDERB is an 8-bit readable/writable register that enables or disables TPC output groups 3 and 2 (TP₁₅ to TP₈) on a bit-by-bit basis.

Bit	7	6	5	4	3	2	1	0
	NDER15	NDER14	NDER13	NDER12	NDER11	NDER10	NDER9	NDER8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 15 to 8

These bits enable or disable
TPC output groups 3 and 2

If a bit is enabled for TPC output by NDERB, then when the 16-bit timer compare match event selected in the TPC output control register (TPCR) occurs, the NDRB value is automatically transferred to the corresponding PBDR bit, updating the output value. If TPC output is disabled, the bit value is not transferred from NDRB to PBDR and the output value does not change.

NDERB is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Next Data Enable 15 to 8 (NDER15 to NDER8): These bits enable or disable TPC output groups 3 and 2 (TP₁₅ to TP₈) on a bit-by-bit basis.

Bits 7 to 0

NDER15 to NDER8	Description
0	TPC outputs TP ₁₅ to TP ₈ are disabled (NDR15 to NDR8 are not transferred to PB ₇ to PB ₀) (Initial value)
1	TPC outputs TP ₁₅ to TP ₈ are enabled (NDR15 to NDR8 are transferred to PB ₇ to PB ₀)

10.2.9 TPC Output Control Register (TPCR)

TPCR is an 8-bit readable/writable register that selects output trigger signals for TPC outputs on a group-by-group basis.

Bit	7	6	5	4	3	2	1	0
	G3CMS1	G3CMS0	G2CMS1	G2CMS0	G1CMS1	G1CMS0	G0CMS1	G0CMS0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

<p>Group 3 compare match select 1 and 0 These bits select the compare match event that triggers TPC output group 3 (TP₁₅ to TP₁₂)</p>	<p>Group 2 compare match select 1 and 0 These bits select the compare match event that triggers TPC output group 2 (TP₁₁ to TP₈)</p>	<p>Group 1 compare match select 1 and 0 These bits select the compare match event that triggers TPC output group 1 (TP₇ to TP₄)</p>	<p>Group 0 compare match select 1 and 0 These bits select the compare match event that triggers TPC output group 0 (TP₃ to TP₀)</p>
--	---	--	--

TPCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 and 6—Group 3 Compare Match Select 1 and 0 (G3CMS1, G3CMS0): These bits select the compare match event that triggers TPC output group 3 (TP₁₅ to TP₁₂).

Bit 7 G3CMS1	Bit 6 G3CMS0	Description
0	0	TPC output group 3 (TP ₁₅ to TP ₁₂) is triggered by compare match in 16-bit timer channel 0
	1	TPC output group 3 (TP ₁₅ to TP ₁₂) is triggered by compare match in 16-bit timer channel 1
1	0	TPC output group 3 (TP ₁₅ to TP ₁₂) is triggered by compare match in 16-bit timer channel 2
	1	TPC output group 3 (TP ₁₅ to TP ₁₂) is triggered by compare match in 16-bit timer channel 2 (Initial value)

Bits 5 and 4—Group 2 Compare Match Select 1 and 0 (G2CMS1, G2CMS0): These bits select the compare match event that triggers TPC output group 2 (TP₁₁ to TP₈).

Bit 5 G2CMS1	Bit 4 G2CMS0	Description
0	0	TPC output group 2 (TP ₁₁ to TP ₈) is triggered by compare match in 16-bit timer channel 0
	1	TPC output group 2 (TP ₁₁ to TP ₈) is triggered by compare match in 16-bit timer channel 1
1	0	TPC output group 2 (TP ₁₁ to TP ₈) is triggered by compare match in 16-bit timer channel 2
	1	TPC output group 2 (TP ₁₁ to TP ₈) is triggered by compare match in 16-bit timer channel 2 (Initial value)

Bits 3 and 2—Group 1 Compare Match Select 1 and 0 (G1CMS1, G1CMS0): These bits select the compare match event that triggers TPC output group 1 (TP₇ to TP₄).

Bit 3 G1CMS1	Bit 2 G1CMS0	Description
0	0	TPC output group 1 (TP ₇ to TP ₄) is triggered by compare match in 16-bit timer channel 0
	1	TPC output group 1 (TP ₇ to TP ₄) is triggered by compare match in 16-bit timer channel 1
1	0	TPC output group 1 (TP ₇ to TP ₄) is triggered by compare match in 16-bit timer channel 2
	1	TPC output group 1 (TP ₇ to TP ₄) is triggered by compare match in 16-bit timer channel 2 (Initial value)

Bits 1 and 0—Group 0 Compare Match Select 1 and 0 (G0CMS1, G0CMS0): These bits select the compare match event that triggers TPC output group 0 (TP₃ to TP₀).

Bit 1 G0CMS1	Bit 0 G0CMS0	Description
0	0	TPC output group 0 (TP ₃ to TP ₀) is triggered by compare match in 16-bit timer channel 0
	1	TPC output group 0 (TP ₃ to TP ₀) is triggered by compare match in 16-bit timer channel 1
1	0	TPC output group 0 (TP ₃ to TP ₀) is triggered by compare match in 16-bit timer channel 2
	1	TPC output group 0 (TP ₃ to TP ₀) is triggered by compare match in 16-bit timer channel 2 (Initial value)

10.2.10 TPC Output Mode Register (TPMR)

TPMR is an 8-bit readable/writable register that selects normal or non-overlapping TPC output for each group.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	G3NOV	G2NOV	G1NOV	G0NOV
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Group 3 non-overlap

Selects non-overlapping TPC output for group 3 (TP₁₅ to TP₁₂)

Group 2 non-overlap

Selects non-overlapping TPC output for group 2 (TP₁₁ to TP₈)

Group 1 non-overlap

Selects non-overlapping TPC output for group 1 (TP₇ to TP₄)

Group 0 non-overlap

Selects non-overlapping TPC output for group 0 (TP₃ to TP₀)

The output trigger period of a non-overlapping TPC output waveform is set in general register B (GRB) in the 16-bit timer channel selected for output triggering. The non-overlap margin is set in general register A (GRA). The output values change at compare match A and B.

For details see section 10.3.4, Non-Overlapping TPC Output.

TPMR is initialized to H'F0 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Reserved: These bits cannot be modified and are always read as 1.

Bit 3—Group 3 Non-Overlap (G3NOV): Selects normal or non-overlapping TPC output for group 3 (TP₁₅ to TP₁₂).

Bit 3 G3NOV	Description
0	Normal TPC output in group 3 (output values change at compare match A in the selected 16-bit timer channel) (Initial value)
1	Non-overlapping TPC output in group 3 (independent 1 and 0 output at compare match A and B in the selected 16-bit timer channel)

Bit 2—Group 2 Non-Overlap (G2NOV): Selects normal or non-overlapping TPC output for group 2 (TP₁₁ to TP₈).

Bit 2 G2NOV	Description
0	Normal TPC output in group 2 (output values change at compare match A in the selected 16-bit timer channel) (Initial value)
1	Non-overlapping TPC output in group 2 (independent 1 and 0 output at compare match A and B in the selected 16-bit timer channel)

Bit 1—Group 1 Non-Overlap (G1NOV): Selects normal or non-overlapping TPC output for group 1 (TP₇ to TP₄).

Bit 1 G1NOV	Description
0	Normal TPC output in group 1 (output values change at compare match A in the selected 16-bit timer channel) (Initial value)
1	Non-overlapping TPC output in group 1 (independent 1 and 0 output at compare match A and B in the selected 16-bit timer channel)

Bit 0—Group 0 Non-Overlap (G0NOV): Selects normal or non-overlapping TPC output for group 0 (TP₃ to TP₀).

Bit 0 G0NOV	Description
0	Normal TPC output in group 0 (output values change at compare match A in the selected 16-bit timer channel) (Initial value)
1	Non-overlapping TPC output in group 0 (independent 1 and 0 output at compare match A and B in the selected 16-bit timer channel)

10.3 Operation

10.3.1 Overview

When corresponding bits in PADDR or PBDDR and NDERA or NDERB are set to 1, TPC output is enabled. The TPC output initially consists of the corresponding PADDR or PBDDR contents. When a compare-match event selected in TPCR occurs, the corresponding NDRA or NDRB bit contents are transferred to PADDR or PBDR to update the output values.

Figure 10.2 illustrates the TPC output operation. Table 10.3 summarizes the TPC operating conditions.

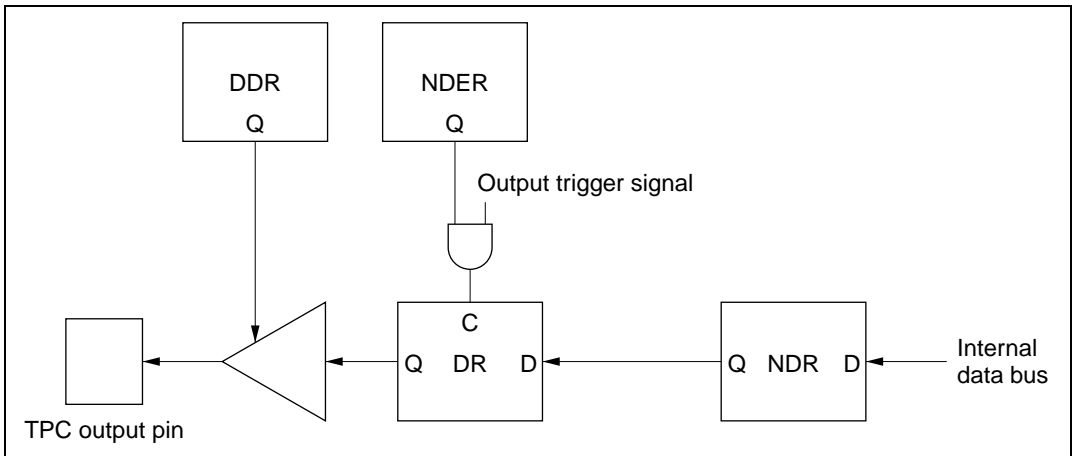

Figure 10.2 TPC Output Operation

Table 10.3 TPC Operating Conditions

NDER	DDR	Pin Function
0	0	Generic input port
	1	Generic output port
1	0	Generic input port (but the DR bit is a read-only bit, and when compare match occurs, the NDR bit value is transferred to the DR bit)
	1	TPC pulse output

Sequential output of up to 16-bit patterns is possible by writing new output data to NDRA and NDRB before the next compare match. For information on non-overlapping operation, see section 10.3.4, Non-Overlapping TPC Output.

10.3.2 Output Timing

If TPC output is enabled, NDRA/NDRB contents are transferred to PADR/PBDR and output when the selected compare match event occurs. Figure 10.3 shows the timing of these operations for the case of normal output in groups 2 and 3, triggered by compare match A.

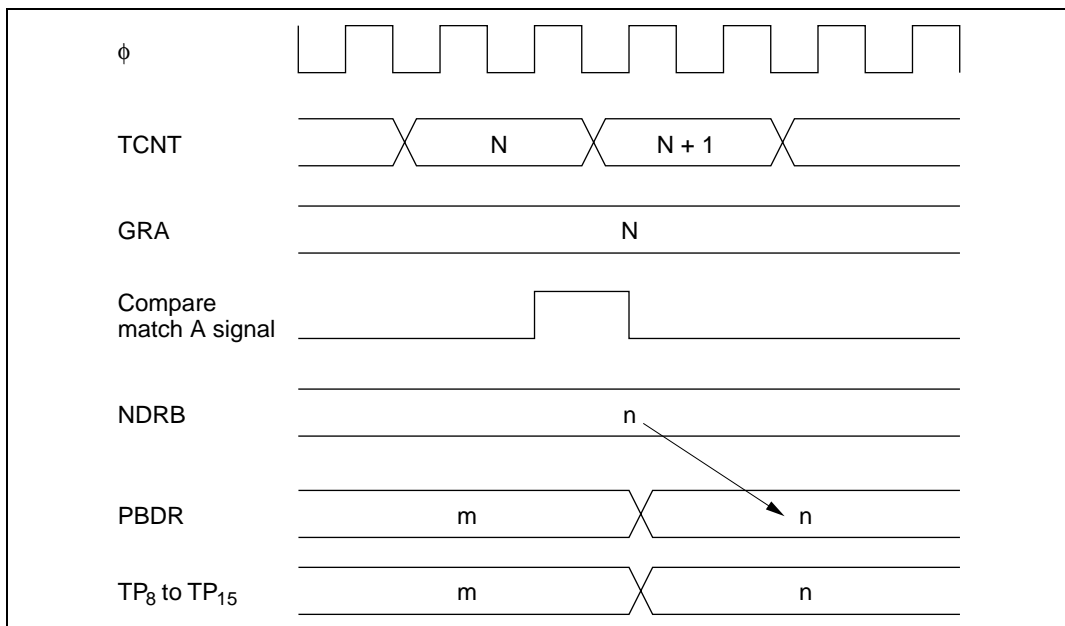

Figure 10.3 Timing of Transfer of Next Data Register Contents and Output (Example)

10.3.3 Normal TPC Output

Sample Setup Procedure for Normal TPC Output: Figure 10.4 shows a sample procedure for setting up normal TPC output.

Figure 10.4 Setup Procedure for Normal TPC Output (Example)

Example of Normal TPC Output (Example of Five-Phase Pulse Output): Figure 10.5 shows an example in which the TPC is used for cyclic five-phase pulse output.

Figure 10.5 Normal TPC Output Example (Five-Phase Pulse Output)

10.3.4 Non-Overlapping TPC Output

Sample Setup Procedure for Non-Overlapping TPC Output: Figure 10.6 shows a sample procedure for setting up non-overlapping TPC output.

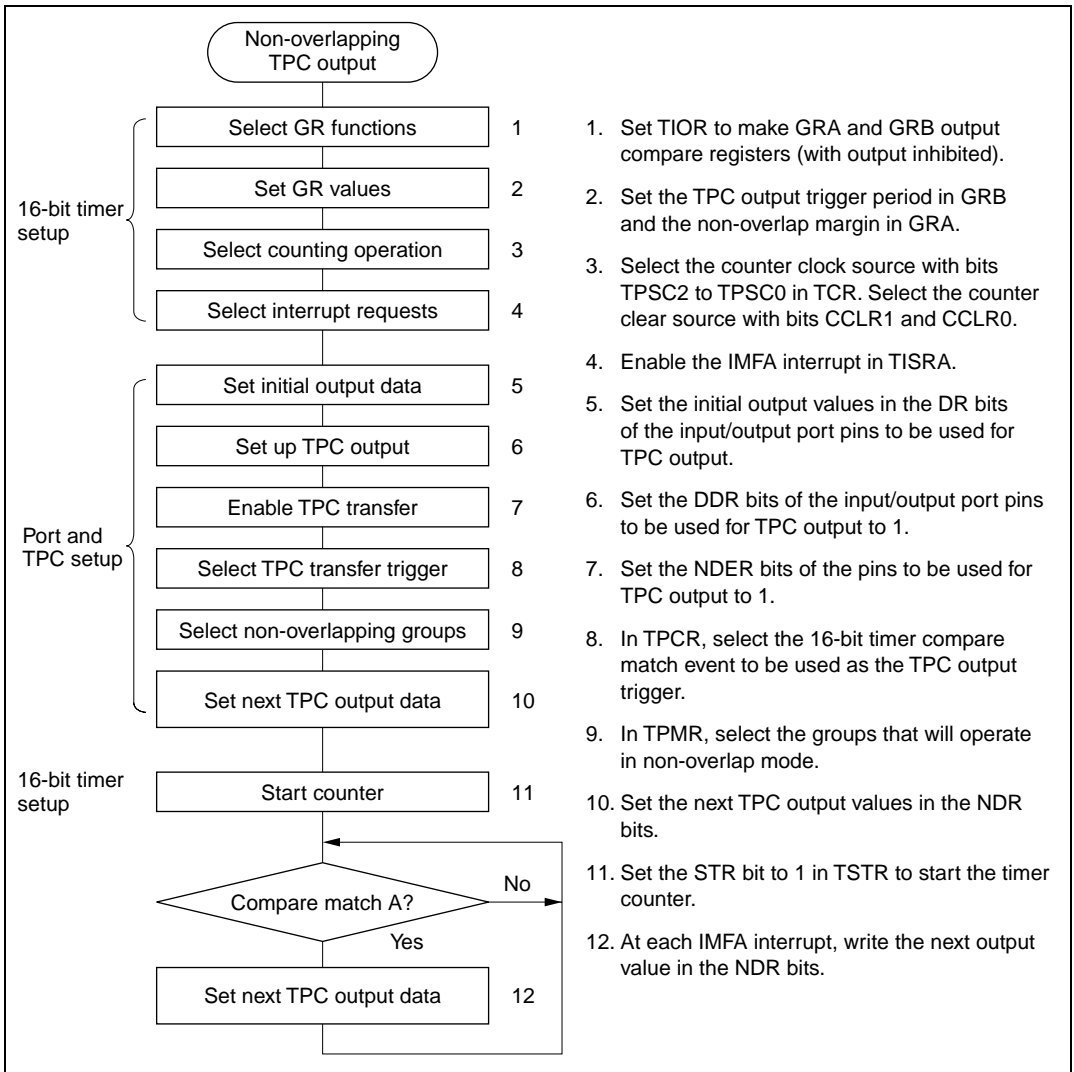

Figure 10.6 Setup Procedure for Non-Overlapping TPC Output (Example)

Example of Non-Overlapping TPC Output (Example of Four-Phase Complementary Non-Overlapping Output): Figure 10.7 shows an example of the use of TPC output for four-phase complementary non-overlapping pulse output.

Figure 10.7 Non-Overlapping TPC Output Example (Four-Phase Complementary Non-Overlapping Pulse Output)

10.3.5 TPC Output Triggering by Input Capture

TPC output can be triggered by 16-bit timer input capture as well as by compare match. If GRA functions as an input capture register in the 16-bit timer channel selected in TPCR, TPC output will be triggered by the input capture signal. Figure 10.8 shows the timing.

Figure 10.8 TPC Output Triggering by Input Capture (Example)

10.4 Usage Notes

10.4.1 Operation of TPC Output Pins

TP₀ to TP₁₅ are multiplexed with 16-bit timer, address bus, and other pin functions. When 16-bit timer, or address bus output is enabled, the corresponding pins cannot be used for TPC output. The data transfer from NDR bits to DR bits takes place, however, regardless of the status of the pin.

Pin functions should be changed only under conditions in which the output trigger event will not occur.

10.4.2 Note on Non-Overlapping Output

During non-overlapping operation, the transfer of NDR bit values to DR bits takes place as follows.

1. NDR bits are always transferred to DR bits at compare match A.
2. At compare match B, NDR bits are transferred only if their value is 0. Bits are not transferred if their value is 1.

Figure 10.9 illustrates the non-overlapping TPC output operation.

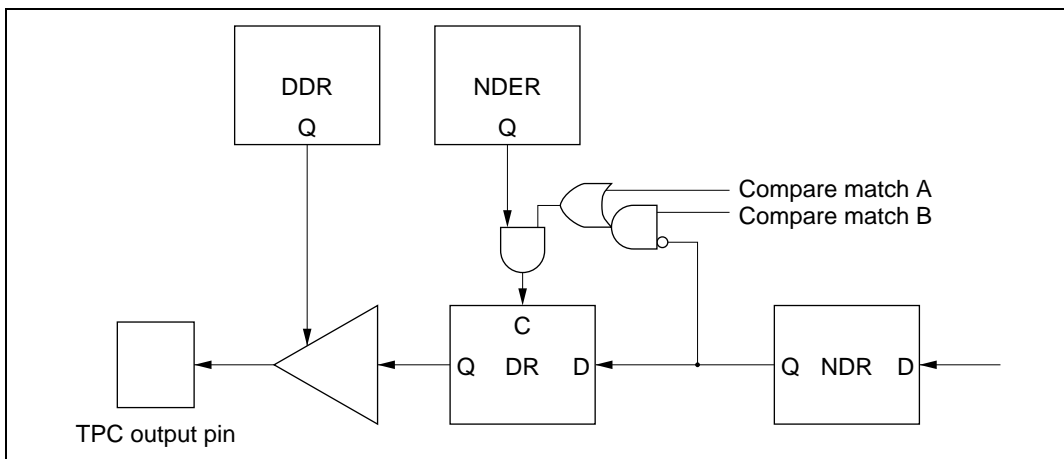

Figure 10.9 Non-Overlapping TPC Output

Therefore, 0 data can be transferred ahead of 1 data by making compare match B occur before compare match A. NDR contents should not be altered during the interval from compare match B to compare match A (the non-overlap margin).

This can be accomplished by having the IMFA interrupt service routine write the next data in NDR. The next data must be written before the next compare match B occurs.

Figure 10.10 shows the timing relationships.

Figure 10.10 Non-Overlapping Operation and NDR Write Timing

Section 11 Watchdog Timer

11.1 Overview

The H8/3062 Group has an on-chip watchdog timer (WDT). The WDT has two selectable functions: it can operate as a watchdog timer to supervise system operation, or it can operate as an interval timer. As a watchdog timer, it generates a reset signal for the H8/3062 chip if a system crash allows the timer counter (TCNT) to overflow before being rewritten. In interval timer operation, an interval timer interrupt is requested at each TCNT overflow.

11.1.1 Features

WDT features are listed below.

- Selection of eight counter clock sources
 $\phi/2$, $\phi/32$, $\phi/64$, $\phi/128$, $\phi/256$, $\phi/512$, $\phi/2048$, or $\phi/4096$
- Interval timer option
- Timer counter overflow generates a reset signal or interrupt.

The reset signal is generated in watchdog timer operation. An interval timer interrupt is generated in interval timer operation.

- Watchdog timer reset signal resets the entire H8/3062 internally, and can also be output externally.

The reset signal generated by timer counter overflow during watchdog timer operation resets the entire H8/3062 internally. An external reset signal can be output from the $\overline{\text{RESO}}$ pin to reset other system devices simultaneously. In the versions with on-chip flash memory, the $\overline{\text{RESO}}$ pin functions as the FWE pin, and therefore there is no function for outputting a reset signal externally.

11.1.2 Block Diagram

Figure 11.1 shows a block diagram of the WDT.

Figure 11.1 WDT Block Diagram

11.1.3 Pin Configuration

Table 11.1 describes the WDT output pin*.

Note: * Not present in the versions with on-chip flash memory.

Table 11.1 WDT Pin

Name	Abbreviation	I/O	Function
Reset output	$\overline{\text{RESO}}$	Output*	External output of the watchdog timer reset signal

Note: * Open-drain output

11.1.4 Register Configuration

Table 11.2 summarizes the WDT registers.

Table 11.2 WDT Registers

Address* ¹		Name	Abbreviation	R/W	Initial Value
Write* ²	Read				
H'FFF8C	H'FFF8C	Timer control/status register	TCSR	R/(W)* ³	H'18
	H'FFF8D	Timer counter	TCNT	R/W	H'00
H'FFF8E	H'FFF8F	Reset control/status register	RSTCSR	R/(W)* ³	H'3F

- Notes: 1. Lower 20 bits of the address in advanced mode
 2. Write word data starting at this address.
 3. Only 0 can be written in bit 7, to clear the flag.

11.2 Register Descriptions

11.2.1 Timer Counter (TCNT)

TCNT is an 8-bit readable and writable up-counter.

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: The method for writing to TCNT is different from that for general registers to prevent inadvertent overwriting. For details see section 11.2.4, Notes on Register Rewriting.

When the TME bit is set to 1 in TCSR, TCNT starts counting pulses generated from an internal clock source selected by bits CKS2 to CKS0 in TCSR. When the count overflows (changes from H'FF to H'00), the OVF bit is set to 1 in TCSR. TCNT is initialized to H'00 by a reset and when the TME bit is cleared to 0.

11.2.2 Timer Control/Status Register (TCSR)

TCSR is an 8-bit readable and writable register. Its functions include selecting the timer mode and clock source.

Bit	7	6	5	4	3	2	1	0
	OVF	WT/IT	TME	—	—	CKS2	CKS1	CKS0
Initial value	0	0	0	1	1	0	0	0
Read/Write	R/(W)*	R/W	R/W	—	—	R/W	R/W	R/W

Overflow flag
 Status flag indicating overflow

Timer mode select
 Selects the mode

Timer enable
 Selects whether TCNT runs or halts

Reserved bits

Clock select
 These bits select the TCNT clock source

Notes: The method for writing to TCSR is different from that for general registers to prevent inadvertent overwriting. For details see section 11.2.4, Notes on Register Rewriting.

* Only 0 can be written, to clear the flag.

Bits 7 to 5 are initialized to 0 by a reset and in standby mode. Bits 2 to 0 are initialized to 0 by a reset. In software standby mode bits 2 to 0 are not initialized, but retain their previous values.

Bit 7—Overflow Flag (OVF): This status flag indicates that the timer counter has overflowed from H'FF to H'00.

Bit 7 OVF	Description
0	[Clearing condition] Cleared by reading OVF when OVF = 1, then writing 0 in OVF (Initial value)
1	[Setting condition] Set when TCNT changes from H'FF to H'00

Bit 6—Timer Mode Select (WT/ \overline{IT}): Selects whether to use the WDT as a watchdog timer or interval timer. If used as an interval timer, the WDT generates an interval timer interrupt request when TCNT overflows. If used as a watchdog timer, the WDT generates a reset signal when TCNT overflows.

Bit 6 WT/ \overline{IT}	Description
0	Interval timer: requests interval timer interrupts (Initial value)
1	Watchdog timer: generates a reset signal

Bit 5—Timer Enable (TME): Selects whether TCNT runs or is halted. When WT/ \overline{IT} = 1, clear the software standby bit (SSBY) to 0 in SYSCR before setting TME. When setting SSBY to 1, TME should be cleared to 0.

Bit 5 TME	Description
0	TCNT is initialized to H'00 and halted (Initial value)
1	TCNT is counting

Bits 4 and 3—Reserved: These bits cannot be modified and are always read as 1.

Bits 2 to 0—Clock Select 2 to 0 (CKS2 to CKS0): These bits select one of eight internal clock sources, obtained by prescaling the system clock (ϕ), for input to TCNT.

Bit 2 CKS2	Bit 1 CKS1	Bit 0 CKS0	Description
0	0	0	$\phi/2$ (Initial value)
		1	$\phi/32$
	1	0	$\phi/64$
		1	$\phi/128$
1	0	0	$\phi/256$
		1	$\phi/512$
	1	0	$\phi/2048$
		1	$\phi/4096$

11.2.3 Reset Control/Status Register (RSTCSR)

RSTCSR is an 8-bit readable and writable register that indicates when a reset signal has been generated by watchdog timer overflow, and controls external output of the reset signal.

Bit	7	6	5	4	3	2	1	0
	WRST	RSTOE	—	—	—	—	—	—
Initial value	0	0	1	1	1	1	1	1
Read/Write	R/(W)*	R/W	—	—	—	—	—	—

Reserved bits

Reset output enable
Enables or disables external output of the reset signal

Watchdog timer reset
Indicates that a reset signal has been generated

Notes: The method for writing to RSTCSR is different from that for general registers to prevent inadvertent overwriting. For details see section 11.2.4, Notes on Register Rewriting.

* Only 0 can be written in bit 7, to clear the flag.

Bits 7 and 6 are initialized by input of a reset signal at the $\overline{\text{RES}}$ pin. They are not initialized by reset signals generated by watchdog timer overflow.

Bit 7—Watchdog Timer Reset (WRST): During watchdog timer operation, this bit indicates that TCNT has overflowed and generated a reset signal. This reset signal resets the entire H8/3062 chip internally. If bit RSTOE is set to 1, this reset signal is also output (low) at the $\overline{\text{RES}}\text{O}$ pin to initialize external system devices. Note that there is no $\overline{\text{RES}}\text{O}$ pin in the versions with on-chip flash memory.

Bit 7

WRST	Description
0	[Clearing conditions] <ul style="list-style-type: none"> • Reset signal at $\overline{\text{RES}}$ pin. • Read WRST when WRST =1, then write 0 in WRST. (Initial value)
1	[Setting condition] Set when TCNT overflow generates a reset signal during watchdog timer operation

Bit 6—Reset Output Enable (RSTOE): Enables or disables external output at the $\overline{\text{RES}}\text{O}$ pin of the reset signal generated if TCNT overflows during watchdog timer operation. Note that there is no $\overline{\text{RES}}\text{O}$ pin in the versions with on-chip flash memory.

Bit 6

RSTOE	Description
0	Reset signal is not output externally (Initial value)
1	Reset signal is output externally

Bits 5 to 0—Reserved: These bits cannot be modified and are always read as 1.

11.2.4 Notes on Register Rewriting

The watchdog timer's TCNT, TCSR, and RSTCSR registers differ from other registers in being more difficult to write. The procedures for writing and reading these registers are given below.

Writing to TCNT and TCSR: These registers must be written by a word transfer instruction. They cannot be written by byte instructions. Figure 11.2 shows the format of data written to TCNT and TCSR. TCNT and TCSR both have the same write address. The write data must be contained in the lower byte of the written word. The upper byte must contain H'5A (password for TCNT) or H'A5 (password for TCSR). This transfers the write data from the lower byte to TCNT or TCSR.

Figure 11.2 Format of Data Written to TCNT and TCSR

Writing to RSTCSR: RSTCSR must be written by a word transfer instruction. It cannot be written by byte transfer instructions. Figure 11.3 shows the format of data written to RSTCSR. To write 0 in the WRST bit, the write data must have H'A5 in the upper byte and H'00 in the lower byte. The data (H'00) in the lower byte is written to RSTCSR, clearing the WRST bit to 0. To write to the RSTOE bit, the upper byte must contain H'5A and the lower byte must contain the write data. Writing this word transfers a write data value into the RSTOE bit.

Figure 11.3 Format of Data Written to RSTCSR

Reading TCNT, TCSR, and RSTCSR: For reads of TCNT, TCSR, and RSTCSR, address H'FFF8C is assigned to TCSR, address H'FFF8D to TCNT, and address H'FFF8F to RSTCSR. These registers are therefore read like other registers. Byte transfer instructions can be used for reading. Table 11.3 lists the read addresses of TCNT, TCSR, and RSTCSR.

Table 11.3 Read Addresses of TCNT, TCSR, and RSTCSR

Address*	Register
H'FFF8C	TCSR
H'FFF8D	TCNT
H'FFF8F	RSTCSR

Note: * Lower 20 bits of the address in advanced mode

11.3 Operation

Operations when the WDT is used as a watchdog timer and as an interval timer are described below.

11.3.1 Watchdog Timer Operation

Figure 11.4 illustrates watchdog timer operation. To use the WDT as a watchdog timer, set the $\overline{WT}/\overline{IT}$ and TME bits to 1 in TCSR. Software must prevent TCNT overflow by rewriting the TCNT value (normally by writing H'00) before overflow occurs. If TCNT fails to be rewritten and overflows due to a system crash etc., the H8/3062 is internally reset for a duration of 518 states.

The watchdog reset signal can be externally output from the \overline{RESO} pin to reset external system devices. The reset signal is output externally for 132 states. External output can be enabled or disabled by the RSTOE bit in RSTCSR. Note that there is no \overline{RESO} pin in the versions with on-chip flash memory.

A watchdog reset has the same vector as a reset generated by input at the \overline{RES} pin. Software can distinguish a \overline{RES} reset from a watchdog reset by checking the WRST bit in RSTCSR.

If a \overline{RES} reset and a watchdog reset occur simultaneously, the \overline{RES} reset takes priority.

Figure 11.4 Operation in Watchdog Timer Mode

11.3.2 Interval Timer Operation

Figure 11.5 illustrates interval timer operation. To use the WDT as an interval timer, clear bit WT/\overline{IT} to 0 and set bit TME to 1 in TCSR. An interval timer interrupt request is generated at each TCNT overflow. This function can be used to generate interval timer interrupts at regular intervals.

Figure 11.5 Interval Timer Operation

11.3.3 Timing of Setting of Overflow Flag (OVF)

Figure 11.6 shows the timing of setting of the OVF flag. The OVF flag is set to 1 when TCNT overflows. At the same time, a reset signal is generated in watchdog timer operation, or an interval timer interrupt is generated in interval timer operation.

Figure 11.6 Timing of Setting of OVF

11.3.4 Timing of Setting of Watchdog Timer Reset Bit (WRST)

The WRST bit in RSTCSR is valid when bits WT/\overline{IT} and TME are both set to 1 in TCSR.

Figure 11.7 shows the timing of setting of WRST and the internal reset timing. The WRST bit is set to 1 when TCNT overflows and OVF is set to 1. At the same time an internal reset signal is generated for the entire H8/3062 chip. This internal reset signal clears OVF to 0, but the WRST bit remains set to 1. The reset routine must therefore clear the WRST bit.

Figure 11.7 Timing of Setting of WRST Bit and Internal Reset

11.4 Interrupts

During interval timer operation, an overflow generates an interval timer interrupt (WOVI). The interval timer interrupt is requested whenever the OVF flag is set to 1 in TCSR.

11.5 Usage Notes

Contention between TCNT Write and Increment: If a timer counter clock pulse is generated during the T_3 state of a write cycle to TCNT, the write takes priority and the timer count is not incremented. See figure 11.8.

Figure 11.8 Contention between TCNT Write and Count up

Changing CKS2 to CKS0 Bit: Halt TCNT by clearing the TME bit to 0 in TCSR before changing the values of bits CKS2 to CKS0.

Section 12 Serial Communication Interface

12.1 Overview

The H8/3062 Group has a serial communication interface (SCI) with two independent channels. The two channels have identical functions. The SCI can communicate in both asynchronous and synchronous mode. It also has a multiprocessor communication function for serial communication among two or more processors.

When the SCI is not used, it can be halted to conserve power. Each SCI channel can be halted independently. For details, see section 21.6, Module Standby Function.

The SCI also has a smart card interface function conforming to the ISO/IEC 7816-3 (Identification Card) standard. This function supports serial communication with a smart card. Switching between the normal serial communication interface and the smart card interface is carried out by means of a register setting.

12.1.1 Features

SCI features are listed below.

- Selection of synchronous or asynchronous mode for serial communication

Asynchronous mode

Serial data communication is synchronized one character at a time. The SCI can communicate with a universal asynchronous receiver/transmitter (UART), asynchronous communication interface adapter (ACIA), or other chip that employs standard asynchronous communication. It can also communicate with two or more other processors using the multiprocessor communication function. There are 12 selectable serial data transfer formats.

- Data length: 7 or 8 bits
- Stop bit length: 1 or 2 bits
- Parity: even/odd/none
- Multiprocessor bit: 1 or 0
- Receive error detection: parity, overrun, and framing errors
- Break detection: by reading the RxD level directly when a framing error occurs

Synchronous mode

Serial data communication is synchronized with a clock signal. The SCI can communicate with other chips having a synchronous communication function.

There is a single serial data communication format.

- Data length: 8 bits
- Receive error detection: overrun errors

- Full-duplex communication

The transmitting and receiving sections are independent, so the SCI can transmit and receive simultaneously. The transmitting and receiving sections are both double-buffered, so serial data can be transmitted and received continuously.

- The following settings can be made for the serial data to be transferred

- LSB-first or MSB-first transfer
- Inversion of data logic level

- Built-in baud rate generator with selectable bit rates

- Selectable transmit/receive clock sources: internal clock from baud rate generator, or external clock from the SCK pin

- Four types of interrupts

Transmit-data-empty, transmit-end, receive-data-full, and receive-error interrupts are requested independently.

Features of the smart card interface are listed below.

- Asynchronous communication

- Data length: 8 bits
- Parity bits generated and checked
- Error signal output in receive mode (parity error)
- Error signal detect and automatic data retransmit in transmit mode
- Supports both direct convention and inverse convention

- Built-in baud rate generator with selectable bit rates

- Three types of interrupts

Transmit-data-empty, receive-data-full, and transmit/receive-error interrupts are requested independently.

12.1.2 Block Diagram

Figure 12.1 shows a block diagram of the SCI.

Figure 12.1 SCI Block Diagram

12.1.3 Pin Configuration

The SCI has serial pins for each channel as listed in table 12.1.

Table 12.1 SCI Pins

Channel	Name	Abbreviation	I/O	Function
0	Serial clock pin	SCK ₀	Input/output	SCI ₀ clock input/output
	Receive data pin	RxD ₀	Input	SCI ₀ receive data input
	Transmit data pin	TxD ₀	Output	SCI ₀ transmit data output
1	Serial clock pin	SCK ₁	Input/output	SCI ₁ clock input/output
	Receive data pin	RxD ₁	Input	SCI ₁ receive data input
	Transmit data pin	TxD ₁	Output	SCI ₁ transmit data output

12.1.4 Register Configuration

The SCI has internal registers as listed in table 12.2. These registers select asynchronous or synchronous mode, specify the data format and bit rate, control the transmitter and receiver sections, and specify switching between the serial communication interface and smart card interface.

Table 12.2 SCI Registers

Channel	Address* ¹	Name	Abbreviation	R/W	Initial Value
0	H'FFFB0	Serial mode register	SMR	R/W	H'00
	H'FFFB1	Bit rate register	BRR	R/W	H'FF
	H'FFFB2	Serial control register	SCR	R/W	H'00
	H'FFFB3	Transmit data register	TDR	R/W	H'FF
	H'FFFB4	Serial status register	SSR	R/(W)* ²	H'84
	H'FFFB5	Receive data register	RDR	R	H'00
	H'FFFB6	Smart card mode register	SCMR	R/W	H'F2
1	H'FFFB8	Serial mode register	SMR	R/W	H'00
	H'FFFB9	Bit rate register	BRR	R/W	H'FF
	H'FFBBA	Serial control register	SCR	R/W	H'00
	H'FFBFB	Transmit data register	TDR	R/W	H'FF
	H'FFBFC	Serial status register	SSR	R/(W)* ²	H'84
	H'FFBFD	Receive data register	RDR	R	H'00
	H'FFBFE	Smart card mode register	SCMR	R/W	H'F2

- Notes: 1. Indicates the lower 20 bits of the address in advanced mode.
 2. Only 0 can be written, to clear flags.

12.2 Register Descriptions

12.2.1 Receive Shift Register (RSR)

RSR is the register that receives serial data.

Bit	7	6	5	4	3	2	1	0
Read/Write	—	—	—	—	—	—	—	—

The SCI loads serial data input at the RxD pin into RSR in the order received, LSB (bit 0) first, thereby converting the data to parallel data. When one byte of data has been received, it is automatically transferred to RDR. The CPU cannot read or write RSR directly.

12.2.2 Receive Data Register (RDR)

RDR is the register that stores received serial data.

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

When the SCI has received one byte of serial data, it transfers the received data from RSR into RDR for storage, completing the receive operation. RSR is then ready to receive the next data. This double-buffering allows data to be received continuously.

RDR is a read-only register. Its contents cannot be modified by the CPU. RDR is initialized to H'00 by a reset and in standby mode.

12.2.3 Transmit Shift Register (TSR)

TSR is the register that transmits serial data.

Bit	7	6	5	4	3	2	1	0
Read/Write	—	—	—	—	—	—	—	—

The SCI loads transmit data from TDR to TSR, then transmits the data serially from the TxD pin, LSB (bit 0) first. After transmitting one data byte, the SCI automatically loads the next transmit data from TDR into TSR and starts transmitting it. If the TDRE flag is set to 1 in SSR, however, the SCI does not load the TDR contents into TSR. The CPU cannot read or write RSR directly.

12.2.4 Transmit Data Register (TDR)

TDR is an 8-bit register that stores data for serial transmission.

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When the SCI detects that TSR is empty, it moves transmit data written in TDR from TDR into TSR and starts serial transmission. Continuous serial transmission is possible by writing the next transmit data in TDR during serial transmission from TSR.

The CPU can always read and write TDR. TDR is initialized to H'FF by a reset and in standby mode.

12.2.5 Serial Mode Register (SMR)

SMR is an 8-bit register that specifies the SCI's serial communication format and selects the clock source for the baud rate generator.

The CPU can always read and write SMR. SMR is initialized to H'00 by a reset and in standby mode.

Bit 7—Communication Mode (C/ \bar{A})/GSM Mode (GM): The function of this bit differs for the normal serial communication interface and for the smart card interface. Its function is switched with the SMIF bit in SCMR.

For Serial Communication Interface (SMIF Bit in SCMR Cleared to 0): Selects whether the SCI operates in asynchronous or synchronous mode.

Bit 7 C/ \bar{A}	Description	
0	Asynchronous mode	(Initial value)
1	Synchronous mode	

For Smart Card Interface (SMIF Bit in SCMR Set to 1): Selects GSM mode for the smart card interface.

Bit 7 GM	Description	
0	The TEND flag is set 12.5 etu after the start bit	(Initial value)
1	The TEND flag is set 11.0 etu after the start bit	

Note: etu: Elementary time unit (time for transfer of 1 bit)

Bit 6—Character Length (CHR): Selects 7-bit or 8-bits data length in asynchronous mode. In synchronous mode, the data length is 8 bits regardless of the CHR setting.

Bit 6 CHR	Description	
0	8-bit data	(Initial value)
1	7-bit data*	

Note: *When 7-bit data is selected, the MSB (bit 7) of TDR is not transmitted.

Bit 5—Parity Enable (PE): In asynchronous mode, this bit enables or disables the addition of a parity bit to transmit data, and the checking of the parity bit in receive data. In synchronous mode, the parity bit is neither added nor checked, regardless of the PE bit setting.

Bit 5 PE	Description	
0	Parity bit not added or checked	(Initial value)
1	Parity bit added and checked*	

Note: *When PE bit is set to 1, an even or odd parity bit is added to transmit data according to the even or odd parity mode selection by the O/ \bar{E} bit, and the parity bit in receive data is checked to see that it matches the even or odd mode selected by the O/ \bar{E} bit.

Bit 4—Parity Mode (O \bar{E}): Specifies whether even parity or odd parity is used for parity addition and checking. The O \bar{E} bit setting is only valid when the PE bit is set to 1, enabling parity bit addition and checking, in asynchronous mode. The O \bar{E} bit setting is ignored in synchronous mode, or when parity addition and checking is disabled in asynchronous mode.

Bit 4

O \bar{E}	Description	
0	Even parity* ¹	(Initial value)
1	Odd parity* ²	

Notes: 1. When even parity is selected, the parity bit added to transmit data makes an even number of 1s in the transmitted character and parity bit combined. Receive data must have an even number of 1s in the received character and parity bit combined.

2. When odd parity is selected, the parity bit added to transmit data makes an odd number of 1s in the transmitted character and parity bit combined. Receive data must have an odd number of 1s in the received character and parity bit combined.

Bit 3—Stop Bit Length (STOP): Selects one or two stop bits in asynchronous mode. This setting is used only in asynchronous mode. In synchronous mod no stop bit is added, so the STOP bit setting is ignored.

Bit 3

STOP	Description	
0	1 stop bit* ¹	(Initial value)
1	2 stop bits* ²	

Notes: 1. One stop bit (with value 1) is added to the end of each transmitted character.

2. Two stop bits (with value 1) are added to the end of each transmitted character.

In receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit. If the second stop bit is 0, it is treated as the start bit of the next incoming character.

Bit 2—Multiprocessor Mode (MP): Selects a multiprocessor format. When a multiprocessor format is selected, parity settings made by the PE and O/\bar{E} bits are ignored. The MP bit setting is valid only in asynchronous mode. It is ignored in synchronous mode.

For further information on the multiprocessor communication function, see section 12.3.3, Multiprocessor Communication.

Bit 2 MP	Description	
0	Multiprocessor function disabled	(Initial value)
1	Multiprocessor format selected	

Bits 1 and 0—Clock Select 1 and 0 (CKS1, CKS0): These bits select the clock source for the on-chip baud rate generator. Four clock sources can be selected by the CKS1 and CKS0 bits: ϕ , $\phi/4$, $\phi/16$, and $\phi/64$.

For the relationship between the clock source, bit rate register setting, and baud rate, see section 12.2.8, Bit Rate Register (BRR).

Bit 1 CKS1	Bit 0 CKS0	Description	
0	0	ϕ	(Initial value)
0	1	$\phi/4$	
1	0	$\phi/16$	
1	1	$\phi/64$	

12.2.6 Serial Control Register (SCR)

SCR register enables or disables the SCI transmitter and receiver, enables or disables serial clock output in asynchronous mode, enables or disables interrupts, and selects the transmit/receive clock source.

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Transmit interrupt enable
Enables or disables transmit-data-empty interrupts (TxI)

Receive interrupt enable
Enables or disables receive-data-full interrupts (RxI) and receive-error interrupts (ERI)

Transmit enable
Enables or disables the transmitter

Receive enable
Enables or disables the receiver

Multiprocessor interrupt enable
Enables or disables multiprocessor interrupts

Transmit-end interrupt enable
Enables or disables transmit-end interrupts (TEI)

Clock enable 1/0
These bits select the SCI clock source

The CPU can always read and write SCR. SCR is initialized to H'00 by a reset and in standby mode.

Bit 7—Transmit Interrupt Enable (TIE): Enables or disables the transmit-data-empty interrupt (TXI) requested when the TDRE flag in SSR is set to 1 due to transfer of serial transmit data from TDR to TSR.

Bit 7 TIE	Description
0	Transmit-data-empty interrupt request (TXI) is disabled* (Initial value)
1	Transmit-data-empty interrupt request (TXI) is enabled

Note: * TXI interrupt requests can be cleared by reading the value 1 from the TDRE flag, then clearing it to 0; or by clearing the TIE bit to 0.

Bit 6—Receive Interrupt Enable (RIE): Enables or disables the receive-data-full interrupt (RXI) requested when the RDRF flag in SSR is set to 1 due to transfer of serial receive data from RSR to RDR; also enables or disables the receive-error interrupt (ERI).

Bit 6 RIE	Description
0	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are disabled* (Initial value)
1	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are enabled

Note: * RXI and ERI interrupt requests can be cleared by reading the value 1 from the RDRF, FER, PER, or ORER flag, then clearing the flag to 0; or by clearing the RIE bit to 0.

Bit 5—Transmit Enable (TE): Enables or disables the start of SCI serial transmitting operations.

Bit 5 TE	Description
0	Transmitting disabled* ¹ (Initial value)
1	Transmitting enabled* ²

Notes: 1. The TDRE flag is fixed at 1 in SSR.
2. In the enabled state, serial transmission starts when the TDRE flag in SSR is cleared to 0 after writing of transmit data into TDR. Select the transmit format in SMR before setting the TE bit to 1.

Bit 4—Receive Enable (RE): Enables or disables the start of SCI serial receiving operations.

Bit 4 RE	Description
0	Receiving disabled* ¹ (Initial value)
1	Receiving enabled* ²

Notes: 1. Clearing the RE bit to 0 does not affect the RDRF, FER, PER, and ORER flags. These flags retain their previous values.

2. In the enabled state, serial receiving starts when a start bit is detected in asynchronous mode, or serial clock input is detected in synchronous mode. Select the receive format in SMR before setting the RE bit to 1.

Bit 3—Multiprocessor Interrupt Enable (MPIE): Enables or disables multiprocessor interrupts. The MPIE bit setting is valid only in asynchronous mode, and only if the MP bit is set to 1 in SMR. The MPIE bit setting is ignored in synchronous mode or when the MP bit is cleared to 0.

Bit 3 MPIE	Description
0	Multiprocessor interrupts are disabled (normal receive operation) (Initial value) [Clearing conditions] <ul style="list-style-type: none"> The MPIE bit is cleared to 0 MPB = 1 in received data
1	Multiprocessor interrupts are enabled* Receive-data-full interrupts (RXI), receive-error interrupts (ERI), and setting of the RDRF, FER, and ORER status flags in SSR are disabled until data with the multiprocessor bit set to 1 is received.

Note: * The SCI does not transfer receive data from RSR to RDR, does not detect receive errors, and does not set the RDRF, FER, and ORER flags in SSR. When it receives data in which MPB = 1, the SCI sets the MPB bit to 1 in SSR, automatically clears the MPIE bit to 0, enables RXI and ERI interrupts (if the TIE and RIE bits in SCR are set to 1), and allows the FER and ORER flags to be set.

Bit 2—Transmit-End interrupt Enable (TEIE): Enables or disables the transmit-end interrupt (TEI) requested if TDR does not contain valid transmit data when the MSB is transmitted.

Bit 2 TEIE	Description
0	Transmit-end interrupt requests (TEI) are disabled* (Initial value)
1	Transmit-end interrupt requests (TEI) are enabled*

Note: * TEI interrupt requests can be cleared by reading the value 1 from the TDRE flag in SSR, then clearing the TDRE flag to 0, thereby also clearing the TEND flag to 0; or by clearing the TEIE bit to 0.

Bits 1 and 0—Clock Enable 1 and 0 (CKE1, CKE0): The function of these bits differs for the normal serial communication interface and for the smart card interface. Their function is switched with the SMIF bit in SCMR.

For serial communication interface (SMIF bit in SCMR cleared to 0): These bits select the SCI clock source and enable or disable clock output from the SCK pin. Depending on the settings of CKE1 and CKE0, the SCK pin can be used for generic input/output, serial clock output, or serial clock input.

The CKE0 setting is valid only in asynchronous mode, and only when the SCI is internally clocked (CKE1 = 0). The CKE0 setting is ignored in synchronous mode, or when an external clock source is selected (CKE1 = 1). Select the SCI operating mode in SMR before setting the CKE1 and CKE0 bits. For further details on selection of the SCI clock source, see table 12.9 in section 12.3, Operation.

Bit 1 CKE1	Bit 0 CKE0	Description
0	0	Asynchronous mode Internal clock, SCK pin available for generic input/output* ¹
		Synchronous mode Internal clock, SCK pin used for serial clock output* ¹
0	1	Asynchronous mode Internal clock, SCK pin used for clock output* ²
		Synchronous mode Internal clock, SCK pin used for serial clock output
1	0	Asynchronous mode External clock, SCK pin used for clock input* ³
		Synchronous mode External clock, SCK pin used for serial clock input
1	1	Asynchronous mode External clock, SCK pin used for clock input* ³
		Synchronous mode External clock, SCK pin used for serial clock input

- Notes: 1. Initial value
 2. The output clock frequency is the same as the bit rate.
 3. The input clock frequency is 16 times the bit rate.

For smart card interface (SMIF bit in SCMR set to 1): These bits, together with the GM bit in SMR, determine whether the SCK pin is used for generic input/output or as the serial clock output pin.

SMR GM	Bit 1 CKE1	Bit 0 CKE0	Description	
0	0	0	SCK pin available for generic input/output	(Initial value)
0	0	1	SCK pin used for clock output	
1	0	0	SCK pin output fixed low	
1	0	1	SCK pin used for clock output	
1	1	0	SCK pin output fixed high	
1	1	1	SCK pin used for clock output	

12.2.7 Serial Status Register (SSR)

SSR is an 8-bit register containing multiprocessor bit values, and status flags that indicate the operating status of the SCI.

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER/ERS	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)* ¹	R/(W)* ¹	R/(W)* ¹	R/(W)* ¹	R/(W)* ¹	R	R	R/W

Multiprocessor bit transfer
Value of multiprocessor bit to be transmitted

Multiprocessor bit
Stores the received multiprocessor bit value

Transmit end*²
Status flag indicating end of transmission

Parity error
Status flag indicating detection of a receive parity error

Framing error (FER)/Error signal status (ERS)*²
Status flag indicating detection of a receive framing error, or flag indicating detection of an error signal

Overrun error
Status flag indicating detection of a receive overrun error

Receive data register full
Status flag indicating that data has been received and stored in RDR

Transmit data register empty
Status flag indicating that transmit data has been transferred from TDR into TSR and new data can be written in TDR

Notes: 1. Only 0 can be written, to clear the flag.

2. Function differs between the normal serial communication interface and the smart card interface.

The CPU can always read and write SSR, but cannot write 1 in the TDRE, RDRF, ORER, PER, and FER flags. These flags can be cleared to 0 only if they have first been read while set to 1. The TEND and MPB flags are read-only bits that cannot be written.

SSR is initialized to H'84 by a reset and in standby mode.

Bit 7—Transmit Data Register Empty (TDRE): Indicates that the SCI has loaded transmit data from TDR into TSR and the next serial data can be written in TDR.

Bit 7 TDRE	Description
0	TDR contains valid transmit data [Clearing condition] Read TDRE when TDRE = 1, then write 0 in TDRE
1	TDR does not contain valid transmit data (Initial value) [Setting conditions] <ul style="list-style-type: none"> • The chip is reset or enters standby mode • The TE bit in SCR is cleared to 0 • TDR contents are loaded into TSR, so new data can be written in TDR

Bit 6—Receive Data Register Full (RDRF): Indicates that RDR contains new receive data.

Bit 6 RDRF	Description
0	RDR does not contain new receive data (Initial value) [Clearing conditions] <ul style="list-style-type: none"> • The chip is reset or enters standby mode • Read RDRF when RDRF = 1, then write 0 in RDRF
1	RDR contains new receive data [Setting condition] Serial data is received normally and transferred from RSR to RDR

Note: The RDR contents and the RDRF flag are not affected by detection of receive errors or by clearing of the RE bit to 0 in SCR. They retain their previous values. If the RDRF flag is still set to 1 when reception of the next data ends, an overrun error will occur and the receive data will be lost.

Bit 5—Overrun Error (ORER): Indicates that data reception ended abnormally due to an overrun error.

Bit 5 ORER	Description
0	Receiving is in progress or has ended normally* ¹ (Initial value) [Clearing conditions] <ul style="list-style-type: none"> • The chip is reset or enters standby mode • Read ORER when ORER = 1, then write 0 in ORER
1	A receive overrun error occurred* ² [Setting condition] Reception of the next serial data ends when RDRF = 1

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the ORER flag, which retains its previous value.
2. RDR continues to hold the receive data prior to the overrun error, so subsequent receive data is lost. Serial receiving cannot continue while the ORER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 4—Framing Error (FER)/Error Signal Status (ERS): The function of this bit differs for the normal serial communication interface and for the smart card interface. Its function is switched with the SMIF bit in SCMR.

For serial communication interface (SMIF bit in SCMR cleared to 0): Indicates that data reception ended abnormally due to a framing error in asynchronous mode.

Bit 4 FER	Description
0	Receiving is in progress or has ended normally* ¹ (Initial value) [Clearing conditions] <ul style="list-style-type: none"> The chip is reset or enters standby mode Read FER when FER = 1, then write 0 in FER
1	A receive framing error occurred [Setting condition] <p>The stop bit at the end of the receive data is checked for a value of 1, and is found to be 0.*²</p>

- Notes: 1. Clearing the RE bit to 0 in SCR does not affect the FER flag, which retains its previous value.
2. When the stop bit length is 2 bits, only the first bit is checked for a value of 1. The second stop bit is not checked. When a framing error occurs the SCI transfers the receive data into RDR but does not set the RDRF flag. Serial receiving cannot continue while the FER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

For Smart Card Interface (SMIF Bit in SCMR Set to 1): Indicates the status of the error signal sent back from the receiving side during transmission. Framing errors are not detected in smart card interface mode.

Bit 4 ERS	Description
0	Normal reception, no error signal* (Initial value) [Clearing conditions] <ul style="list-style-type: none"> The chip is reset or enters standby mode Read ERS when ERS = 1, then write 0 in ERS
1	An error signal has been sent from the receiving side indicating detection of a parity error [Setting condition] <p>The error signal is low when sampled</p>

Note: * Clearing the TE bit to 0 in SCR does not affect the ERS flag, which retains its previous value.

Bit 3—Parity Error (PER): Indicates that reception of data with parity added ended abnormally due to a parity error in asynchronous mode.

Bit 3 PER	Description
0	Receiving is in progress or has ended normally* ¹ (Initial value) [Clearing conditions] <ul style="list-style-type: none"> The chip is reset or enters standby mode Read PER when PER = 1, then write 0 in PER
1	A receive parity error occurred* ² [Setting condition] <p>The number of 1s in receive data, including the parity bit, does not match the even or odd parity setting of O/E in SMR</p>

- Notes: 1. Clearing the RE bit to 0 in SCR does not affect the PER flag, which retains its previous value.
2. When a parity error occurs the SCI transfers the receive data into RDR but does not set the RDRF flag. Serial receiving cannot continue while the PER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 2—Transmit End (TEND): The function of this bit differs for the normal serial communication interface and for the smart card interface. Its function is switched with the SMIF bit in SCMR.

For Serial Communication Interface (SMIF Bit in SCMR Cleared to 0): Indicates that when the last bit of a serial character was transmitted TDR did not contain valid transmit data, so transmission has ended. The TEND flag is a read-only bit and cannot be written.

Bit 2 TEND	Description
0	Transmission is in progress [Clearing condition] <p>Read TDRE when TDRE = 1, then write 0 in TDRE</p>
1	End of transmission (Initial value) [Setting conditions] <ul style="list-style-type: none"> The chip is reset or enters standby mode The TE bit in SCR is cleared to 0 TDRE is 1 when the last bit of a 1-byte serial transmit character is transmitted

For Smart Card Interface (SMIF Bit in SCMR Set to 1): Indicates that when the last bit of a serial character was transmitted TDR did not contain valid transmit data, so transmission has ended. The TEND flag is a read-only bit and cannot be written.

Bit 2 TEND	Description
0	Transmission is in progress [Clearing condition] Read TDRE when TDRE = 1, then write 0 in TDRE
1	End of transmission (Initial value) [Setting conditions] <ul style="list-style-type: none"> The chip is reset or enters standby mode The TE bit is cleared to 0 in SCR and the FER/ERS bit is also cleared to 0 TDRE is 1 and FER/ERS is 0 (normal transmission) 2.5 etu (when GM = 0) or 1.0 etu (when GM = 1) after a 1-byte serial character is transmitted

Note: etu: Elementary time unit (time for transfer of 1 bit)

Bit 1—Multiprocessor bit (MPB): Stores the value of the multiprocessor bit in the receive data when a multiprocessor format is used in asynchronous mode. MPB is a read-only bit, and cannot be written.

Bit 1 MPB	Description
0	Multiprocessor bit value in receive data is 0* (Initial value)
1	Multiprocessor bit value in receive data is 1

Note: * If the RE bit in SCR is cleared to 0 when a multiprocessor format is selected, MPB retains its previous value.

Bit 0—Multiprocessor Bit Transfer (MPBT): Stores the value of the multiprocessor bit added to transmit data when a multiprocessor format is selected for transmitting in asynchronous mode.

The MPBT bit setting is ignored in synchronous mode, when a multiprocessor format is not selected, or when the SCI cannot transmit.

Bit 0 MPBT	Description
0	Multiprocessor bit value in transmit data is 0 (Initial value)
1	Multiprocessor bit value in transmit data is 1

12.2.8 Bit Rate Register (BRR)

BRR is an 8-bit register that sets the serial transmit/receive bit rate in accordance with the baud rate generator operating clock selected by bits CKS0 and CKS1 in SMR.

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

BRR can be read or written to by the CPU at all times.

BRR is initialized to H'FF by a reset and in standby mode.

As baud rate generator control is performed independently for each channel, different values can be set for each channel.

Table 12.3 shows examples of BRR settings in asynchronous mode. Table 12.4 shows examples of BRR settings in synchronous mode.

Table 12.3 Examples of Bit Rates and BRR Settings in Asynchronous Mode

Bit Rate (bit/s)	ϕ (MHz)											
	2			2.097152			2.4576			3

2.5M					—	—	0	0*	—	—	—	—	—	—	—	—	—	—
4M											0	0*	—	—	—	—	—	—

Note: Settings with an error of 1% or less are recommended.

Legend:

Blank : No setting available

— : Setting possible, but error occurs

* : Continuous transmission/reception not possible

The BRR setting is calculated as follows:

Asynchronous mode:

$$N = \frac{\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

Synchronous mode:

$$N = \frac{\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)

N: BRR setting for baud rate generator ($0 \leq N \leq 255$)

ϕ : System clock frequency (MHz)

n: Baud rate generator input clock ($n = 0, 1, 2, 3$)

(For the clock sources and values of n, see the following table.)

n	Clock Source	SMR Settings	
		CKS1	CKS0
0	ϕ	0	0
1	$\phi/4$	0	1
2	$\phi/16$	1	0
3	$\phi/64$	1	1

The bit rate error in asynchronous mode is calculated as follows:

$$\text{Error (\%)} = \left\{ \frac{\phi \times 10^6}{(N + 1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$

Table 12.5 shows the maximum bit rates in asynchronous mode for various system clock frequencies. Tables 12.6 and 12.7 show the maximum bit rates with external clock input.

12.3 Operation

12.3.1 Overview

The SCI can carry out serial communication in two modes: asynchronous mode in which synchronization is achieved character by character, and synchronous mode in which synchronization is achieved with clock pulses. A smart card interface is also supported as a serial communication function for an IC card interface.

Selection of asynchronous or synchronous mode and the transmission format for the normal serial communication interface is made in SMR, as shown in table 12.8. The SCI clock source is selected by the C/\bar{A} bit in SMR and the CKE1 and CKE0 bits in SCR, as shown in table 12.9.

For details of the procedures for switching between LSB-first and MSB-first mode and inverting the data logic level, see section 13.2.1, Smart Card Mode Register (SCMR).

For selection of the smart card interface format, see section 13.3.3, Data Format.

Asynchronous Mode

- Data length is selectable: 7 or 8 bits
- Parity and multiprocessor bits are selectable, and so is the stop bit length (1 or 2 bits). These selections determine the communication format and character length.
- In receiving, it is possible to detect framing errors, parity errors, overrun errors, and the break state.
- An internal or external clock can be selected as the SCI clock source.
 - When an internal clock is selected, the SCI operates using the on-chip baud rate generator, and can output a serial clock signal with a frequency matching the bit rate.
 - When an external clock is selected, the external clock input must have a frequency 16 times the bit rate (The on-chip baud rate generator is not used).

Synchronous Mode

- The communication format has a fixed 8-bit data length.
- In receiving, it is possible to detect overrun errors.
- An internal or external clock can be selected as the SCI clock source.
 - When an internal clock is selected, the SCI operates using the on-chip baud rate generator, and can output a serial clock signal to external devices.
 - When an external clock is selected, the SCI operates on the input serial clock. The on-chip baud rate generator is not used.

Smart Card Interface

- One frame consists of 8-bit data and a parity bit.
- In transmitting, a guard time of at least two elementary time units (2 etu) is provided between the end of the parity bit and the start of the next frame (elementary time units: time for transfer of 1 bit).
- In receiving, if a parity error is detected, a low error signal level is output for 1 etu, beginning 10.5 etu after the start bit.
- In transmitting, if an error signal is received, the same data is automatically transmitted again after at least 2 etu.
- Only asynchronous communication is supported. There is no synchronous communication function.

For details of smart card interface operation, see section 13, Smart Card Interface.

Table 12.8 SMR Settings and Serial Communication Formats

SMR Settings					SCI Communication Format											
Bit 7 C/ \bar{A}	Bit 6 CHR	Bit 2 MP	Bit 5 PE	Bit 3 STOP	Mode	Data Length	Multi- processor Bit	Parity Bit	Stop Bit Length

		1			
1	1	0	Synchronous mode	Internal	Outputs the serial clock
		1			

12.3.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with one or two stop bits. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCI are independent, so full-duplex communication is possible. The transmitter and the receiver are both double-buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmitting and receiving.

Figure 12.2 shows the general format of asynchronous serial communication. In asynchronous serial communication the communication line is normally held in the mark (high) state. The SCI monitors the line and starts serial communication when the line goes to the space (low) state, indicating a start bit. One serial character consists of a start bit (low), data (LSB first), parity bit (high or low), and one or two stop bits (high), in that order.

When receiving in asynchronous mode, the SCI synchronizes at the falling edge of the start bit. The SCI samples each data bit on the eighth pulse of a clock with a frequency 16 times the bit rate. Receive data is latched at the center of each bit.

**Figure 12.2 Data Format in Asynchronous Communication
(Example: 8-Bit Data with Parity and 2 Stop Bits)**

Communication Formats

Table 12.10 shows the 12 communication formats that can be selected in asynchronous mode. The format is selected by settings in SMR.

Table 12.10 Serial Communication Formats (Asynchronous Mode)

SMR Settings				Serial Communication Format and Frame Length													
CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12		
0	0	0	0	S	8-bit data								STOP				
0	0	0	1	S	8-bit data								STOP	STOP			
0	1	0	0	S	8-bit data								P	STOP			
0	1	0	1	S	8-bit data								P	STOP	STOP		
1	0	0	0	S	7-bit data							STOP					
1	0	0	1	S	7-bit data							STOP	STOP				
1	1	0	0	S	7-bit data							P	STOP				
1	1	0	1	S	7-bit data							P	STOP	STOP			
0	—	1	0	S	8-bit data								MPB	STOP			
0	—	1	1	S	8-bit data								MPB	STOP	STOP		
1	—	1	0	S	7-bit data							MPB	STOP				
1	—	1	1	S	7-bit data							MPB	STOP	STOP			

Legend:

S : Start bit

STOP : Stop bit

P : Parity bit

MPB : Multiprocessor bit

Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the SCI transmit/receive clock. The clock source is selected by the $\overline{C/A}$ bit in SMR and bits CKE1 and CKE0 in SCR. For details of SCI clock source selection, see table 12.9.

When an external clock is input at the SCK pin, it must have a frequency 16 times the desired bit rate.

When the SCI is operated on an internal clock, it can output a clock signal at the SCK pin. The frequency of this output clock is equal to the bit rate. The phase is aligned as shown in figure 12.3 so that the rising edge of the clock occurs at the center of each transmit data bit.

Figure 12.3 Phase Relationship between Output Clock and Serial Data (Asynchronous Mode)

Transmitting and Receiving Data

SCI Initialization (Asynchronous Mode): Before transmitting or receiving data, clear the TE and RE bits to 0 in SCR, then initialize the SCI as follows.

When changing the communication mode or format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing TE to 0 sets the TDRE flag to 1 and initializes TSR. Clearing RE to 0, however, does not initialize the RDRF, PER, FER, and ORER flags, or RDR, which retain their previous contents.

When an external clock is used the clock should not be stopped during initialization or subsequent operation, since operation will be unreliable in this case.

Figure 12.4 shows a sample flowchart for initializing the SCI.

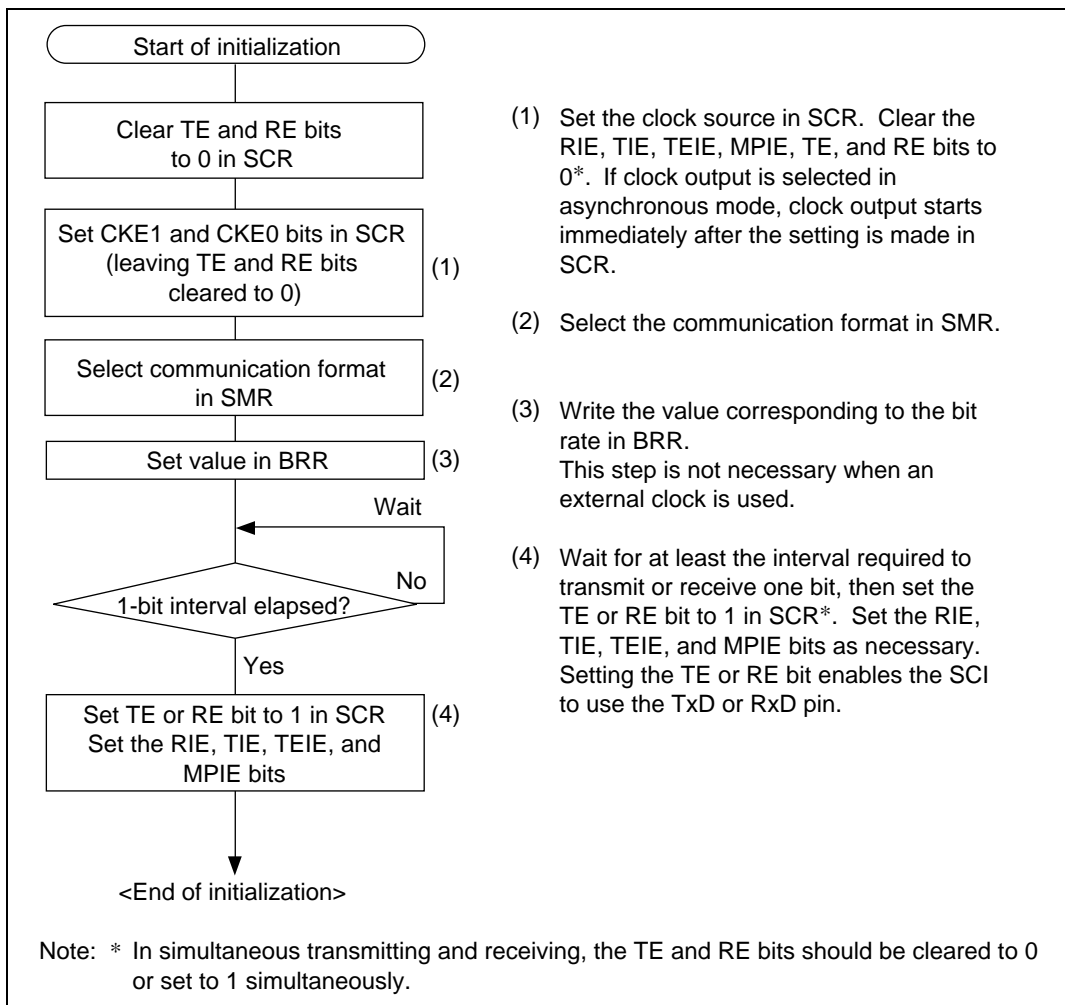

Figure 12.4 Sample Flowchart for SCI Initialization

Transmitting Serial Data (Asynchronous Mode): Figure 12.5 shows a sample flowchart for transmitting serial data and indicates the procedure to follow.

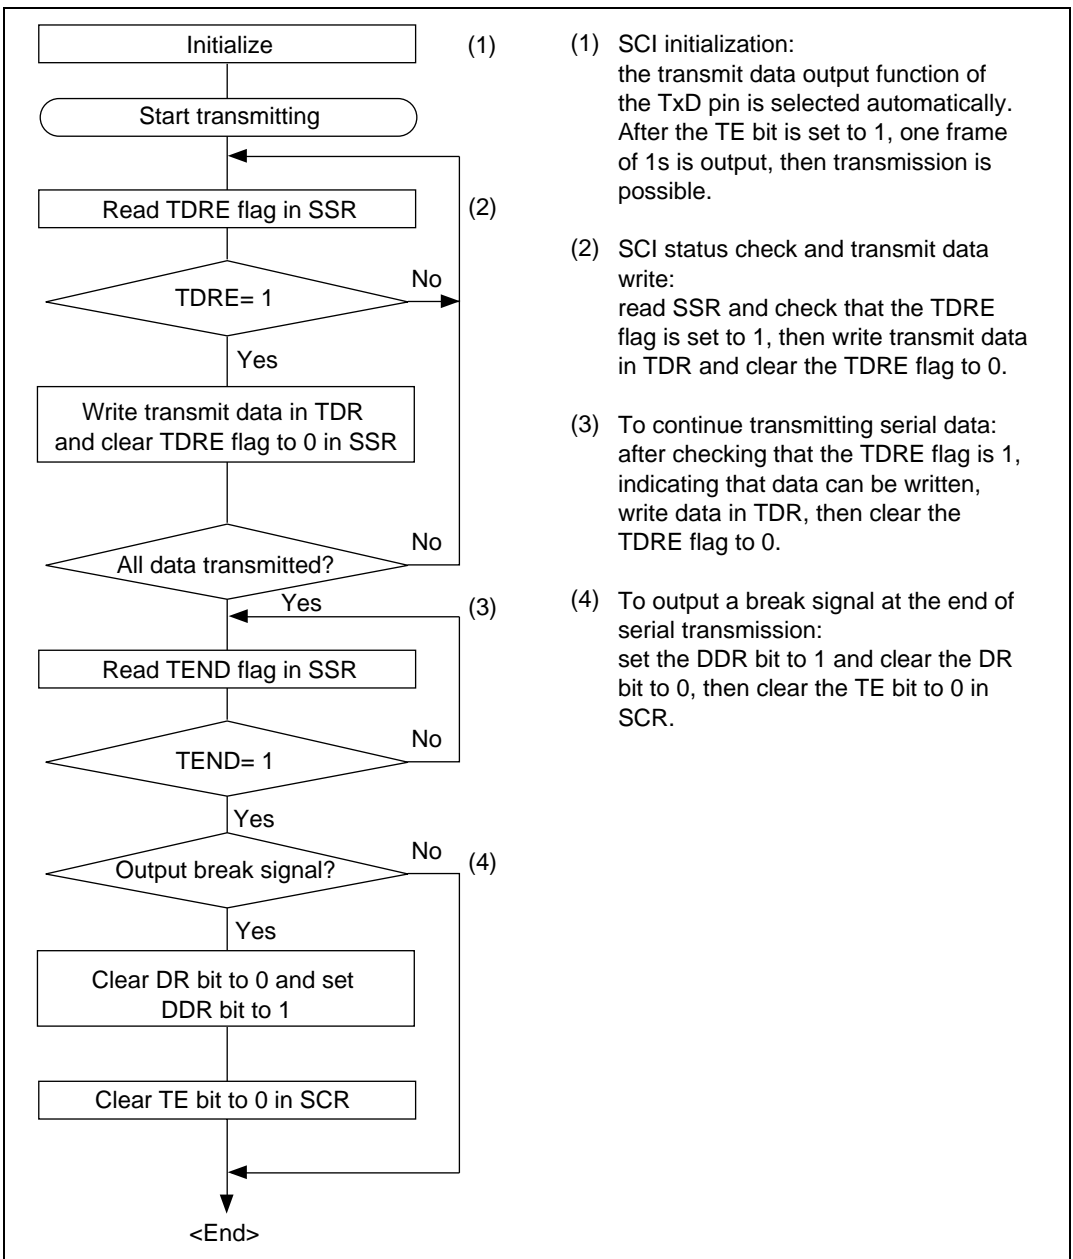

Figure 12.5 Sample Flowchart for Transmitting Serial Data

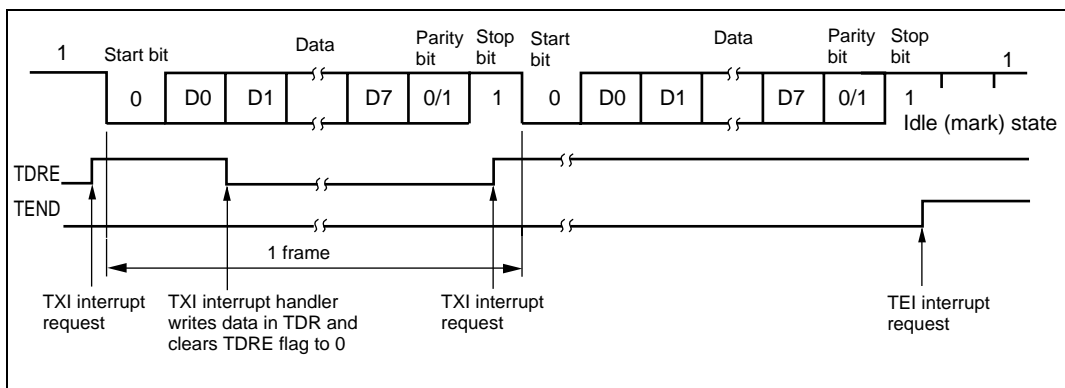

In transmitting serial data, the SCI operates as follows:

- The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0, the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.
- After loading the data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

Serial transmit data is transmitted in the following order from the TxD pin.

- Start bit: One 0 bit is output.
 - Transmit data: 7 or 8 bits are output, LSB first.
 - Parity bit or multiprocessor bit: One parity bit (even or odd parity), or one multiprocessor bit is output. Formats in which neither a parity bit nor a multiprocessor bit is output can also be selected.
 - Stop bit(s): One or two 1 bits (stop bits) are output.
 - Mark state: Output of 1 bits continues until the start bit of the next transmit data.
- The SCI checks the TDRE flag when it outputs the stop bit. If the TDRE flag is 0, the SCI loads new data from TDR into TSR, outputs the stop bit, then begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, outputs the stop bit, then continues output of 1 bits in the mark state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.

Figure 12.6 shows an example of SCI transmit operation in asynchronous mode.

**Figure 12.6 Example of SCI Transmit Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit)**

Receiving Serial Data (Asynchronous Mode): Figure 12.7 shows a sample flowchart for receiving serial data and indicates the procedure to follow.

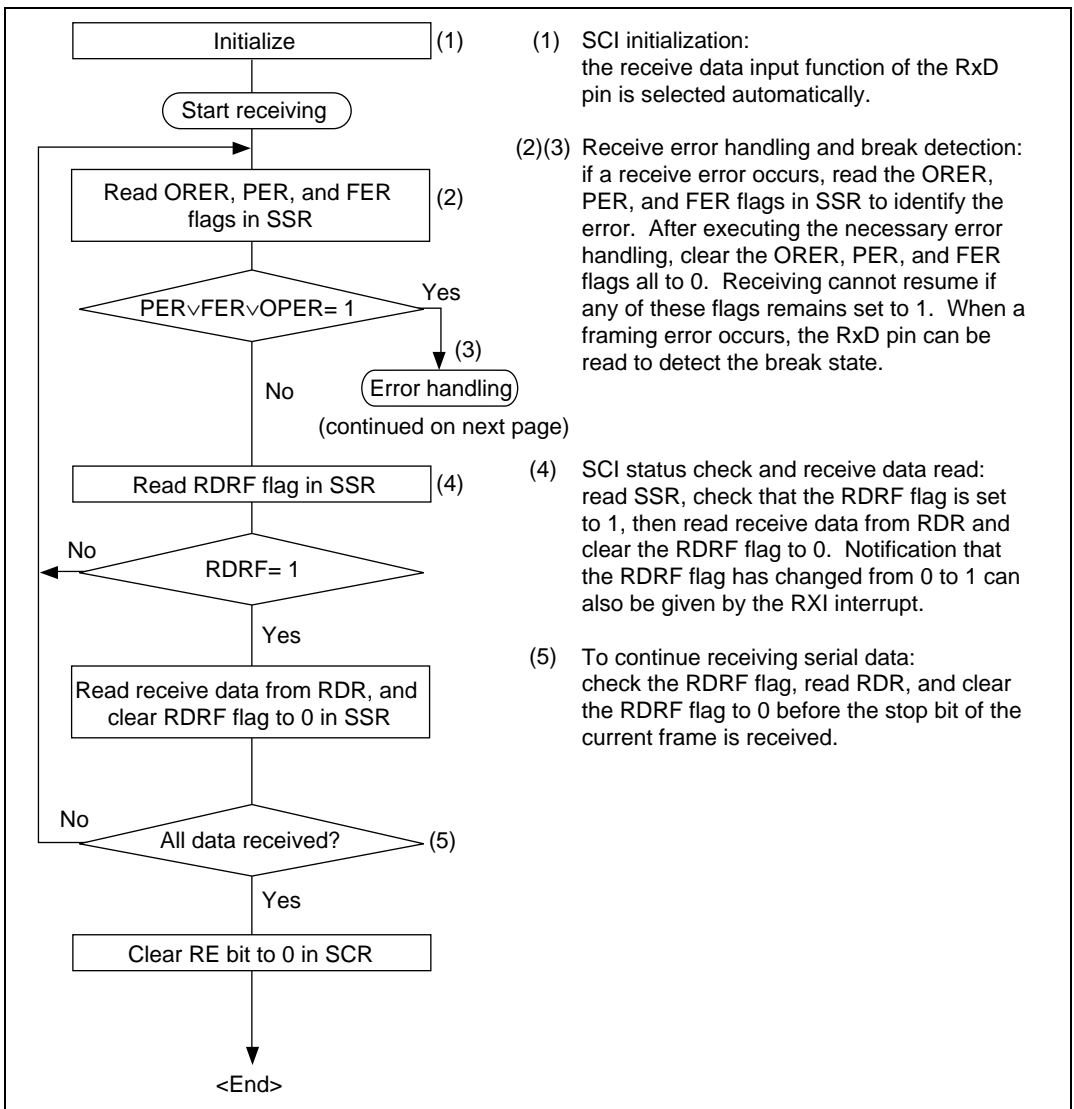

Figure 12.7 Sample Flowchart for Receiving Serial Data

Figure 12.7 Sample Flowchart for Receiving Serial Data (cont)

In receiving, the SCI operates as follows:

- The SCI monitors the communication line. When it detects a start bit (0 bit), the SCI synchronizes internally and starts receiving.
- Receive data is stored in RSR in order from LSB to MSB.
- The parity bit and stop bit are received.

After receiving these bits, the SCI carries out the following checks.

- Parity check: The number of 1s in the receive data must match the even or odd parity setting of in the O/\bar{E} bit in SMR.
- Stop bit check: The stop bit value must be 1. If there are two stop bits, only the first is checked.
- Status check: The RDRF flag must be 0, indicating that the receive data can be transferred from RSR into RDR.

If these all checks pass, the RDRF flag is set to 1 and the received data is stored in RDR. If one of the checks fails (receive error*), the SCI operates as shown in table 12.11.

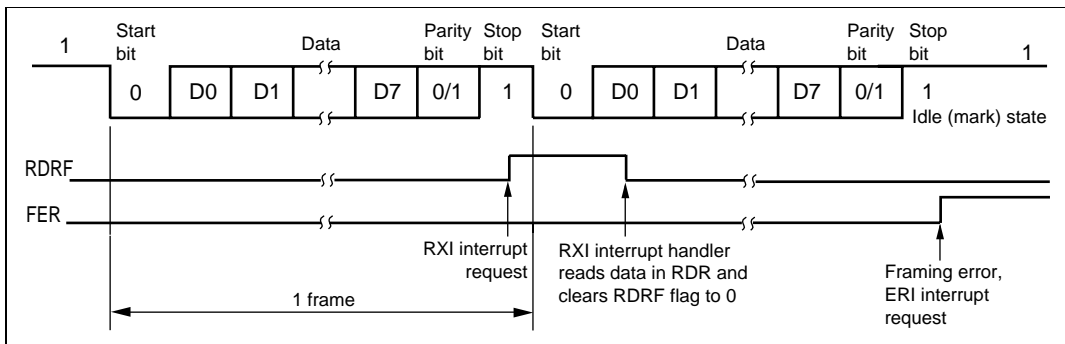

Note: * When a receive error occurs, further receiving is disabled. In receiving, the RDRF flag is not set to 1. Be sure to clear the error flags to 0.

- When the RDRF flag is set to 1, if the RIE bit is set to 1 in SCR, a receive-data-full interrupt (RXI) is requested. If the ORER, PER, or FER flag is set to 1 and the RIE bit in SCR is also set to 1, a receive-error interrupt (ERI) is requested.

Table 12.11 Receive Error Conditions

Receive Error	Abbreviation	Condition	Data Transfer
Overrun error	ORER	Receiving of next data ends while RDRF flag is still set to 1 in SSR	Receive data is not transferred from RSR to RDR
Framing error	FER	Stop bit is 0	Receive data is transferred from RSR to RDR
Parity error	PER	Parity of received data differs from even/odd parity setting in SMR	Receive data is transferred from RSR to RDR

Figure 12.8 shows an example of SCI receive operation in asynchronous mode.

**Figure 12.8 Example of SCI Receive Operation
(8-Bit Data with Parity and One Stop Bit)**

12.3.3 Multiprocessor Communication

The multiprocessor communication function enables several processors to share a single serial communication line. The processors communicate in asynchronous mode using a format with an additional multiprocessor bit (multiprocessor format).

In multiprocessor communication, each receiving processor is addressed by an ID. A serial communication cycle consists of an ID-sending cycle that identifies the receiving processor, and a data-sending cycle. The multiprocessor bit distinguishes ID-sending cycles from data-sending cycles.

The transmitting processor starts by sending the ID of the receiving processor with which it wants to communicate as data with the multiprocessor bit set to 1. Next the transmitting processor sends transmit data with the multiprocessor bit cleared to 0.

Receiving processors skip incoming data until they receive data with the multiprocessor bit set to 1. When they receive data with the multiprocessor bit set to 1, receiving processors compare the data with their IDs. Processors with IDs not matching the received data skip further incoming data until they again receive data with the multiprocessor bit set to 1. Multiple processors can send and receive data in this way.

Figure 12.9 shows an example of communication among different processors using a multiprocessor format.

Communication Formats

Four formats are available. Parity bit settings are ignored when a multiprocessor format is selected. For details see table 12.10.

Clock

See the description of asynchronous mode.

Figure 12.9 Example of Communication among Processors using Multiprocessor Format (Sending Data H'AA to Receiving Processor A)

Transmitting and Receiving Data

Transmitting Multiprocessor Serial Data: Figure 12.10 shows a sample flowchart for transmitting multiprocessor serial data and indicates the procedure to follow.

Figure 12.10 Sample Flowchart for Transmitting Multiprocessor Serial Data

In transmitting serial data, the SCI operates as follows:

- The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0, the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.
- After loading the data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

Serial transmit data is transmitted in the following order from the TxD pin.

— Start bit: One 0 bit is output.

— Transmit data: 7 or 8 bits are output, LSB first.

— Multiprocessor bit: One multiprocessor bit (MPBT value) is output.

— Stop bit(s): One or two 1 bits (stop bits) are output.

— Mark state: Output of 1 bits continues until the start bit of the next transmit data.

- The SCI checks the TDRE flag when it outputs the stop bit. If the TDRE flag is 0, the SCI loads new data from TDR into TSR, outputs the stop bit, then begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, outputs the stop bit, then continues output of 1 bits in the mark state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.

Figure 12.11 shows an example of SCI transmit operation using a multiprocessor format.

**Figure 12.11 Example of SCI Transmit Operation
(8-Bit Data with Multiprocessor Bit and One Stop Bit)**

Receiving Multiprocessor Serial Data: Figure 12.12 shows a sample flowchart for receiving multiprocessor serial data and indicates the procedure to follow.

Figure 12.12 Sample Flowchart for Receiving Multiprocessor Serial Data

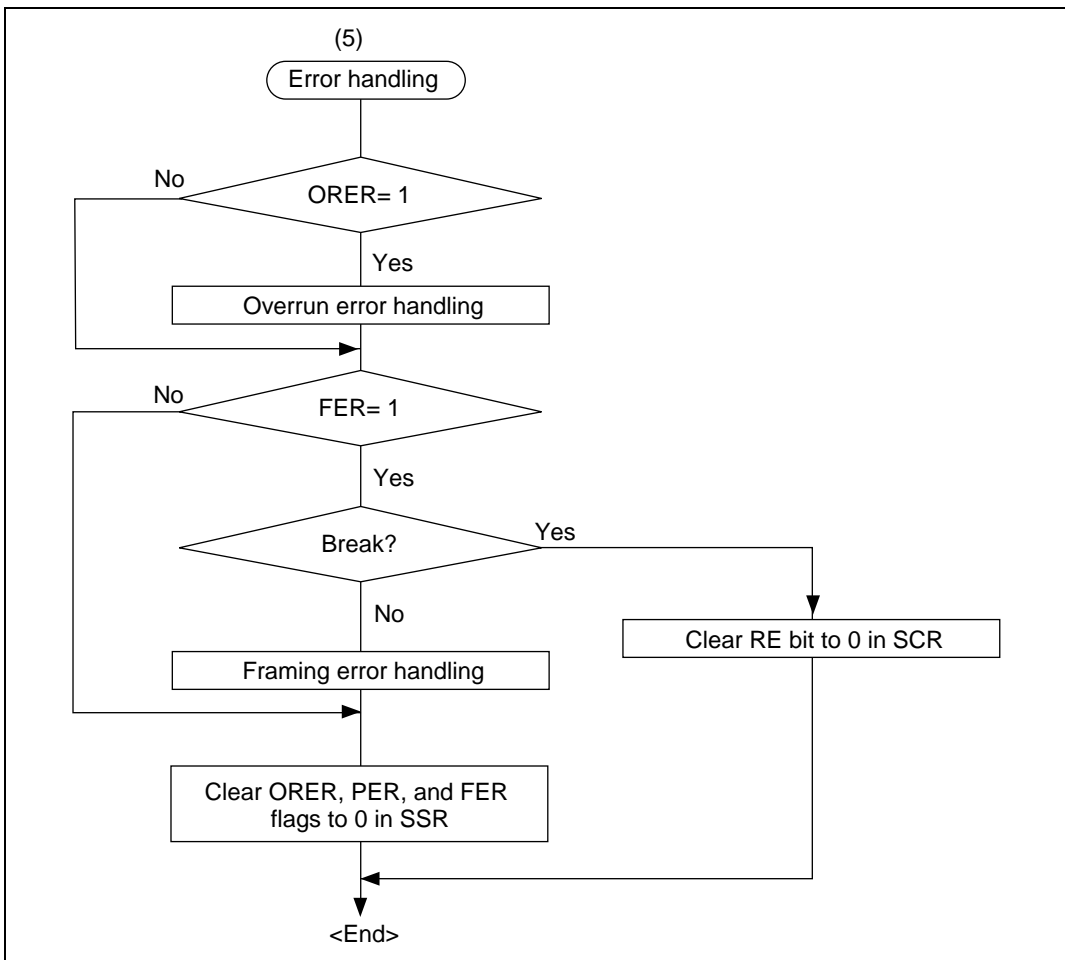

**Figure 12.12 Sample Flowchart for Receiving Multiprocessor Serial Data (cont)**

Figure 12.13 shows an example of SCI receive operation using a multiprocessor format.

**Figure 12.13 Example of SCI Receive Operation
(8-Bit Data with Multiprocessor Bit and One Stop Bit)**

12.3.4 Synchronous Operation

In synchronous mode, the SCI transmits and receives data in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

The SCI transmitter and receiver share the same clock but are otherwise independent, so full-duplex communication is possible. The transmitter and the receiver are also double-buffered, so continuous transmitting or receiving is possible by reading or writing data while transmitting or receiving is in progress.

Figure 12.14 shows the general format in synchronous serial communication.

Figure 12.14 Data Format in Synchronous Communication

In synchronous serial communication, each data bit is placed on the communication line from one falling edge of the serial clock to the next. Data is guaranteed valid at the rise of the serial clock. In each character, the serial data bits are transferred in order from LSB (first) to MSB (last). After output of the MSB, the communication line remains in the state of the MSB. In synchronous mode the SCI receives data by synchronizing with the rise of the serial clock.

Communication Format

The data length is fixed at 8 bits. No parity bit or multiprocessor bit can be added.

Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected by means of the C/\bar{A} bit in SMR and the CKE1 and CKE0 bits in SCR. See table 12.6 for details of SCI clock source selection.

When the SCI operates on an internal clock, it outputs the clock source at the SCK pin. Eight clock pulses are output per transmitted or received character. When the SCI is not transmitting or receiving, the clock signal remains in the high state. If receiving in single-character units is required, an external clock should be selected.

Transmitting and Receiving Data

SCI Initialization (Synchronous Mode): Before transmitting or receiving data, clear the TE and RE bits to 0 in SCR, then initialize the SCI as follows.

When changing the communication mode or format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing TE to 0 sets the TDRE flag to 1 and initializes TSR. Clearing RE to 0, however, does not initialize the RDRF, PER, FER, and ORER flags, or RDR, which retain their previous contents.

Figure 12.15 shows a sample flowchart for initializing the SCI.

Figure 12.15 Sample Flowchart for SCI Initialization

Transmitting Serial Data (Synchronous Mode): Figure 12.16 shows a sample flowchart for transmitting serial data and indicates the procedure to follow.

Figure 12.16 Sample Flowchart for Serial Transmitting

In transmitting serial data, the SCI operates as follows.

- The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0, the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.
- After loading the data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

If clock output is selected, the SCI outputs eight serial clock pulses. If an external clock source is selected, the SCI outputs data in synchronization with the input clock. Data is output from the TxD pin in order from LSB (bit 0) to MSB (bit 7).

- The SCI checks the TDRE flag when it outputs the MSB (bit 7). If the TDRE flag is 0, the SCI loads data from TDR into TSR and begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, and after transmitting the MSB, holds the TxD pin in the MSB state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.
- After the end of serial transmission, the SCK pin is held in a constant state.

Figure 12.17 shows an example of SCI transmit operation.

Figure 12.17 Example of SCI Transmit Operation

Receiving Serial Data (Synchronous Mode): Figure 12.18 shows a sample flowchart for receiving serial data and indicates the procedure to follow. When switching from asynchronous to synchronous mode, make sure that the ORER, PER, and FER flags are cleared to 0. If the FER or PER flag is set to 1 the RDRF flag will not be set and both transmitting and receiving will be disabled.

Figure 12.18 Sample Flowchart for Serial Receiving

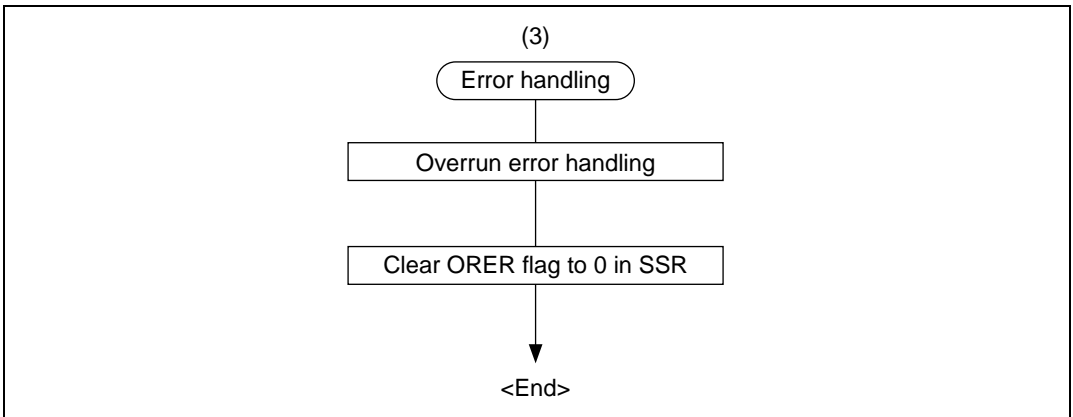

Figure 12.18 Sample Flowchart for Serial Receiving (cont)

In receiving, the SCI operates as follows:

- The SCI synchronizes with serial clock input or output and synchronizes internally.
- Receive data is stored in RSR in order from LSB to MSB.
After receiving the data, the SCI checks that the RDRF flag is 0, so that receive data can be transferred from RSR to RDR. If this check passes, the RDRF flag is set to 1 and the received data is stored in RDR. If the check fails (receive error), the SCI operates as shown in table 12.11.
When a receive error has been identified in the error check, subsequent transmit and receive operations are disabled.
- When the RDRF flag is set to 1, if the RIE bit is set to 1 in SCR, a receive-data-full interrupt (RXI) is requested. If the ORER flag is set to 1 and the RIE bit in SCR is also set to 1, a receive-error interrupt (ERI) is requested.

Figure 12.19 shows an example of SCI receive operation.

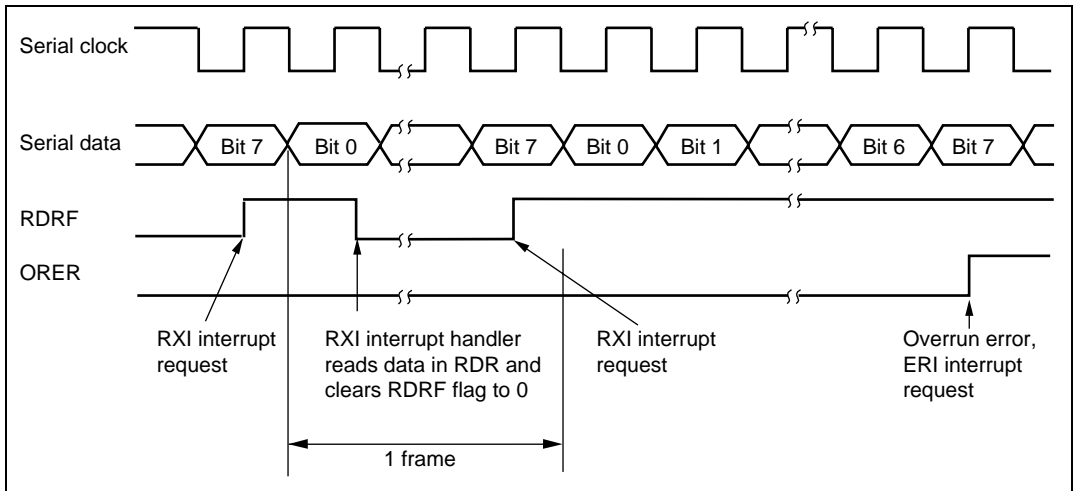

Figure 12.19 Example of SCI Receive Operation

Transmitting and Receiving Data Simultaneously (Synchronous Mode): Figure 12.20 shows a sample flowchart for transmitting and receiving serial data simultaneously and indicates the procedure to follow.

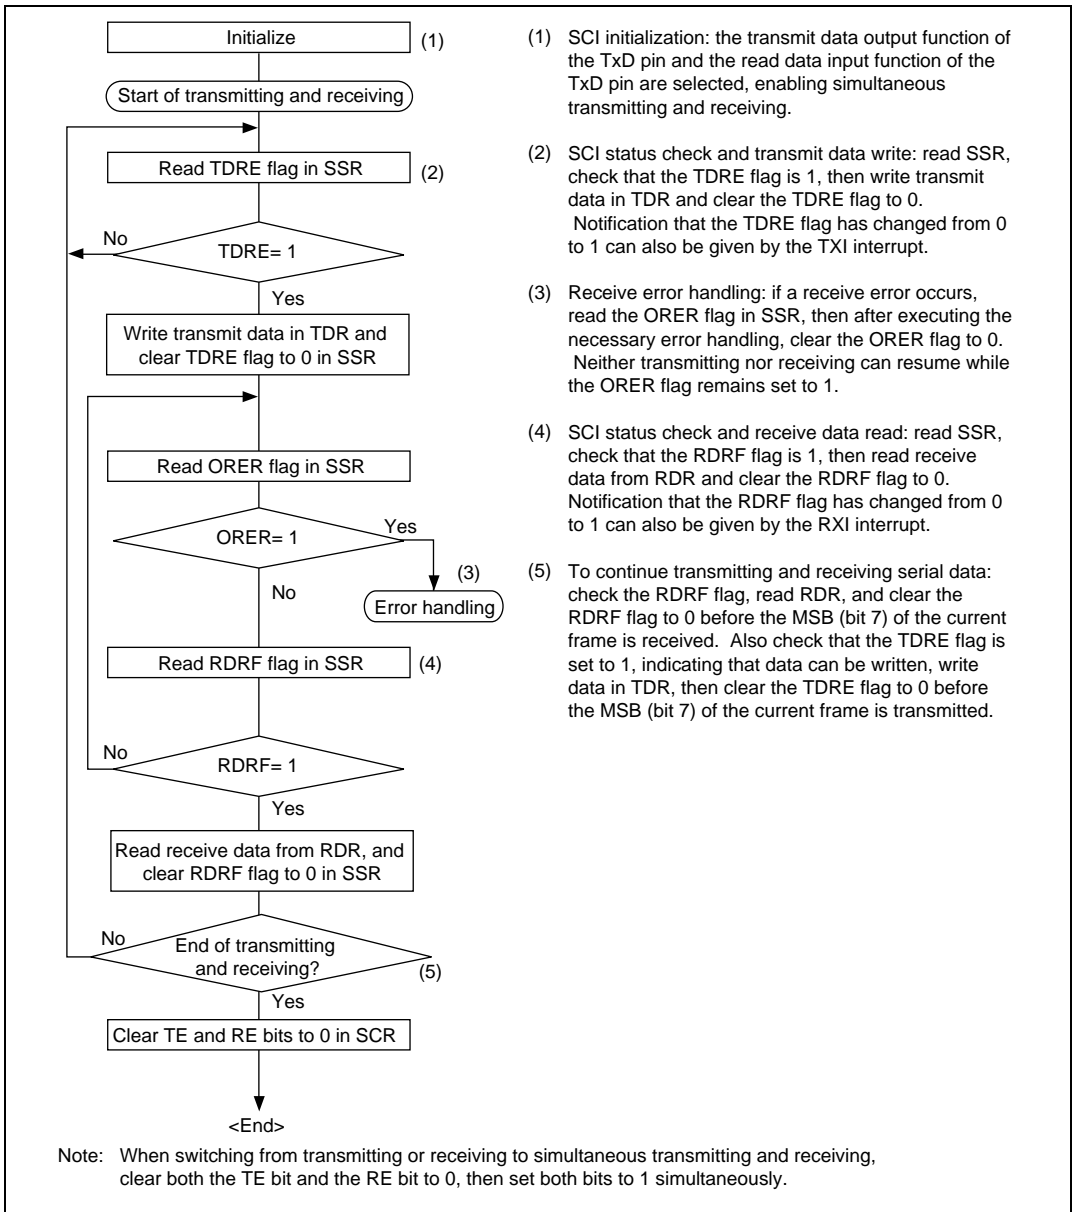

Figure 12.20 Sample Flowchart for Simultaneous Serial Transmitting and Receiving

12.4 SCI Interrupts

The SCI has four interrupt request sources: transmit-end interrupt (TEI), receive-error (ERI), receive-data-full (RXI), and transmit-data-empty interrupt (TXI). Table 12.12 lists the interrupt sources and indicates their priority. These interrupts can be enabled or disabled by the TIE, RIE, and TEIE bits in SCR. Each interrupt request is sent separately to the interrupt controller.

A TXI interrupt is requested when the TDRE flag is set to 1 in SSR. A TEI interrupt is requested when the TEND flag is set to 1 in SSR.

An RXI interrupt is requested when the RDRF flag is set to 1 in SSR. An ERI interrupt is requested when the ORER, PER, or FER flag is set to 1 in SSR.

Table 12.12 SCI Interrupt Sources

Interrupt Source	Description	Priority
ERI	Receive error (ORER, FER, or PER)	High
RXI	Receive data register full (RDRF)	↑
TXI	Transmit data register empty (TDRE)	
TEI	Transmit end (TEND)	Low

12.5 Usage Notes

12.5.1 Notes on Use of SCI

Note the following points when using the SCI.

TDR Write and TDRE Flag: The TDRE flag in SSR is a status flag indicating the loading of transmit data from TDR to TSR. The SCI sets the TDRE flag to 1 when it transfers data from TDR to TSR.

Data can be written into TDR regardless of the state of the TDRE flag. If new data is written in TDR when the TDRE flag is 0, the old data stored in TDR will be lost because this data has not yet been transferred to TSR. Before writing transmit data in TDR, be sure to check that the TDRE flag is set to 1.

Simultaneous Multiple Receive Errors: Table 12.13 shows the state of the SSR status flags when multiple receive errors occur simultaneously. When an overrun error occurs the RSR contents are not transferred to RDR, so receive data is lost.

Table 12.13 SSR Status Flags and Transfer of Receive Data

SSR Status Flags				Receive Data Transfer	Receive Errors
RDRF	ORER	FER	PER	RSR → RDR	
1	1	0	0	×	Overrun error
0	0	1	0	○	Framing error
0	0	0	1	○	Parity error
1	1	1	0	×	Overrun error + framing error
1	1	0	1	×	Overrun error + parity error
0	0	1	1	○	Framing error + parity error
1	1	1	1	×	Overrun error + framing error + parity error

Legend:

- : Receive data is transferred from RSR to RDR.
- ×: Receive data is not transferred from RSR to RDR.

Break Detection and Processing: Break signals can be detected by reading the RxD pin directly when a framing error (FER) is detected. In the break state the input from the RxD pin consists of all 0s, so the FER flag is set and the parity error flag (PER) may also be set. In the break state the SCI receiver continues to operate, so if the FER flag is cleared to 0 it will be set to 1 again.

Sending a Break Signal: The input/output condition and level of the TxD pin are determined by DR and DDR bits. This feature can be used to send a break signal.

After the serial transmitter is initialized, the DR value substitutes for the mark state until the TE bit is set to 1 (the TxD pin function is not selected until the TE bit is set to 1). The DDR and DR bits should therefore be set to 1 beforehand.

To send a break signal during serial transmission, clear the DR bit to 0, then clear the TE bit to 0. When the TE bit is cleared to 0 the transmitter is initialized, regardless of its current state, so the TxD pin becomes an input/output outputting the value 0.

Receive Error Flags and Transmitter Operation (Synchronous Mode Only): When a receive error flag (ORER, PER, or FER) is set to 1 the SCI will not start transmitting, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 when starting to transmit. Note that clearing the RE bit to 0 does not clear the receive error flags to 0.

Receive Data Sampling Timing in Asynchronous Mode and Receive Margin: In asynchronous mode the SCI operates on a base clock with 16 times the bit rate frequency. In receiving, the SCI synchronizes internally with the fall of the start bit, which it samples on the base clock. Receive data is latched at the rising edge of the eighth base clock pulse. See figure 12.21.

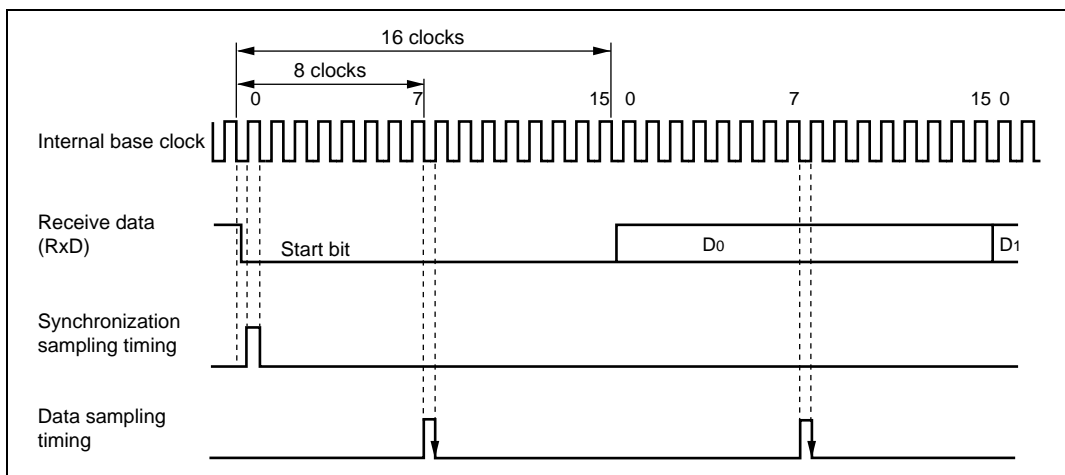

Figure 12.21 Receive Data Sampling Timing in Asynchronous Mode

The receive margin in asynchronous mode can therefore be expressed as shown in equation (1).

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\% \quad \dots \dots \dots (1)$$

M: Receive margin (%)

N: Ratio of clock frequency to bit rate (N = 16)

D: Clock duty cycle (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute deviation of clock frequency

From equation (1), if F = 0 and D = 0.5, the receive margin is 46.875%, as given by equation (2).

When D = 0.5 and F = 0:

$$\begin{aligned} M &= \left(0.5 - \frac{1}{2 \times 16} \right) \times 100\% \\ &= 46.875\% \quad \dots \dots \dots (2) \end{aligned}$$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

Restrictions on Use of an External Clock Source:

- When an external clock source is used for the serial clock, after updates TDR, allow an inversion of at least five system clock (ϕ) cycles before input of the serial clock to start transmitting. If the serial clock is input within four states of the TDR update, a malfunction may occur (See figure 12.22).

Figure 12.22 Example of Synchronous Transmission

Switching from SCK Pin Function to Port Pin Function:

- Problem in Operation: When switching the SCK pin function to the output port function (high-level output) by making the following settings while $DDR = 1$, $DR = 1$, $C/\bar{A} = 1$, $CKE1 = 0$, $CKE0 = 0$, and $TE = 1$ (synchronous mode), low-level output occurs for one half-cycle.
1. End of serial data transmission
 2. TE bit = 0
 3. C/\bar{A} bit = 0 ... switchover to port output
 4. Occurrence of low-level output (see figure 12.23)

Figure 12.23 Operation when Switching from SCK Pin Function to Port Pin Function

- **Sample Procedure for Avoiding Low-Level Output:** As this sample procedure temporarily places the SCK pin in the input state, the SCK/port pin should be pulled up beforehand with an external circuit.

With $DDR = 1$, $DR = 1$, $C/\bar{A} = 1$, $CKE1 = 0$, $CKE0 = 0$, and $TE = 1$, make the following settings in the order shown.

1. End of serial data transmission
2. TE bit = 0
3. $CKE1$ bit = 1
4. C/\bar{A} bit = 0 ... switchover to port output
5. $CKE1$ bit = 0

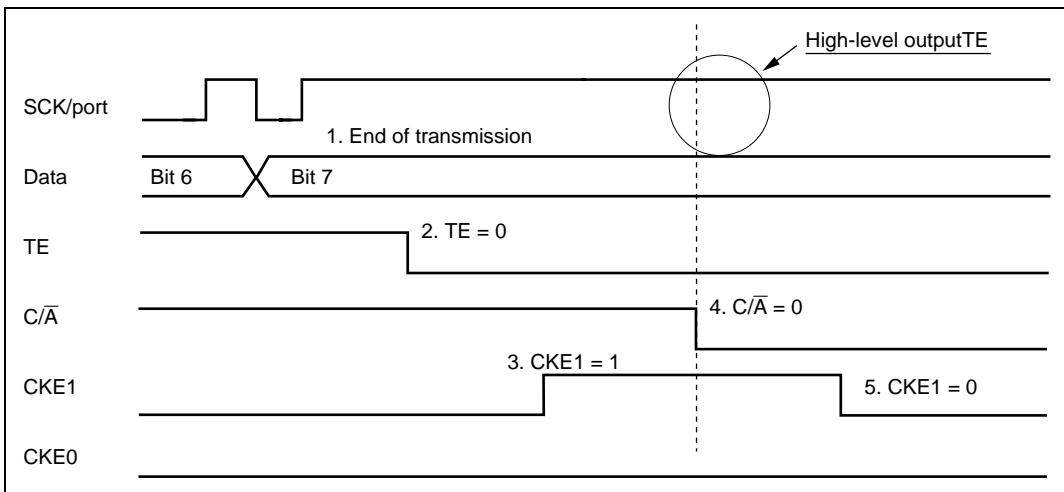

Figure 12.24 Operation when Switching from SCK Pin Function to Port Pin Function (Example of Preventing Low-Level Output)

Section 13 Smart Card Interface

13.1 Overview

The SCI supports an IC card (smart card) interface handling ISO/IEC7816-3 (Identification Card) character transmission as a serial communication interface expansion function.

Switchover between the normal serial communication interface and the smart card interface is controlled by a register setting.

13.1.1 Features

Features of the smart card interface supported by the H8/3062 Group are listed below.

- Asynchronous communication
 - Data length: 8 bits
 - Parity bit generation and checking
 - Transmission of error signal (parity error) in receive mode
 - Error signal detection and automatic data retransmission in transmit mode
 - Direct convention and inverse convention both supported
- Built-in baud rate generator allows any bit rate to be selected
- Three interrupt sources
 - There are three interrupt sources—transmit-data-empty, receive-data-full, and transmit/receive error—that can issue requests independently.

13.1.2 Block Diagram

Figure 13.1 shows a block diagram of the smart card interface.

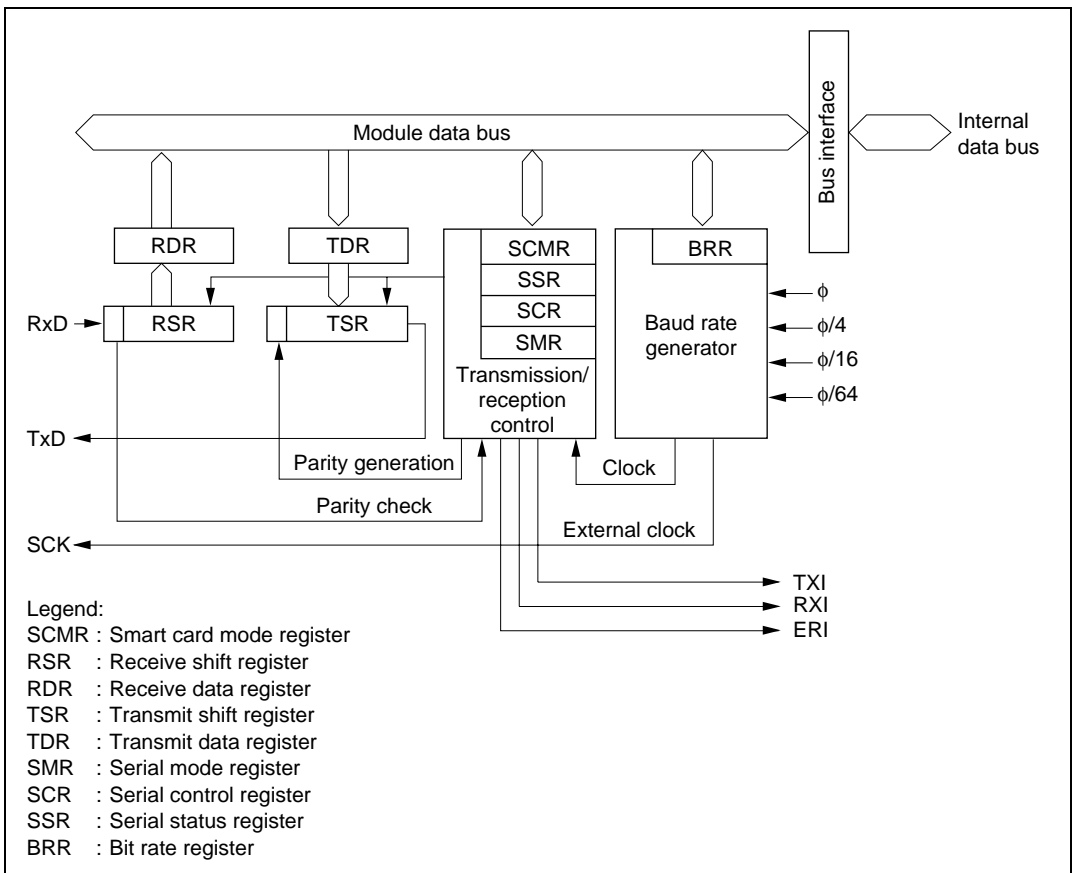

Figure 13.1 Block Diagram of Smart Card Interface

13.1.3 Pin Configuration

Table 13.1 shows the smart card interface pins.

Table 13.1 Smart Card Interface Pins

Pin Name	Abbreviation	I/O	Function
Serial clock pin	SCK	I/O	Clock input/output
Receive data pin	RxD	Input	Receive data input
Transmit data pin	TxD	Output	Transmit data output

13.1.4 Register Configuration

The smart card interface has the internal registers listed in table 13.2. The BRR, TDR, and RDR registers have their normal serial communication interface functions, as described in section 12, Serial Communication Interface.

Table 13.2 Smart Card Interface Registers

Channel	Address*1	Name	Abbreviation	R/W	Initial Value
0	H'FFFB0	Serial mode register	SMR	R/W	H'00
	H'FFFB1	Bit rate register	BRR	R/W	H'FF
	H'FFFB2	Serial control register	SCR	R/W	H'00
	H'FFFB3	Transmit data register	TDR	R/W	H'FF
	H'FFFB4	Serial status register	SSR	R/(W)*2	H'84
	H'FFFB5	Receive data register	RDR	R	H'00
	H'FFFB6	Smart card mode register	SCMR	R/W	H'F2
1	H'FFFB8	Serial mode register	SMR	R/W	H'00
	H'FFFB9	Bit rate register	BRR	R/W	H'FF
	H'FFBBA	Serial control register	SCR	R/W	H'00
	H'FFFB B	Transmit data register	TDR	R/W	H'FF
	H'FFFB C	Serial status register	SSR	R/(W)*2	H'84
	H'FFFB D	Receive data register	RDR	R	H'00
	H'FFFB E	Smart card mode register	SCMR	R/W	H'F2

- Notes: 1. Lower 20 bits of the address in advanced mode
 2. Only 0 can be written in bits 7 to 3, to clear the flags.

13.2 Register Descriptions

This section describes the new or modified registers and bit functions in the smart card interface.

13.2.1 Smart Card Mode Register (SCMR)

SCMR is an 8-bit readable/writable register that selects smart card interface functions.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SDIR	SINV	—	SMIF
Initial value	1	1	1	1	0	0	1	0
Read/Write	—	—	—	—	R/W	R/W	—	R/W

Reserved bits (Bits 7, 6, 5, 4)
Reserved bit (Bit 1)
Smart card interface mode select
 Enables or disables the smart card interface function
Smart card data invert
 Inverts data logic levels
Smart card data transfer direction
 Selects the serial/parallel conversion format

SCMR is initialized to HF2 by a reset and in standby mode.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bit 3—Smart Card Data Transfer Direction (SDIR): Selects the serial/parallel conversion format^{*1}.

Bit 3 SDIR	Description
0	TDR contents are transmitted LSB-first Receive data is stored LSB-first in RDR (Initial value)
1	TDR contents are transmitted MSB-first Receive data is stored MSB-first in RDR

Bit 2—Smart Card Data Invert (SINV): Specifies inversion of the data logic level. This function is used in combination with the SDIR bit to communicate with inverse-convention cards*2. The SINV bit does not affect the logic level of the parity bit. For parity settings, see section 13.3.4, Register Settings.

Bit 2 SINV	Description	
0	Unmodified TDR contents are transmitted Receive data is stored unmodified in RDR	(Initial value)
1	Inverted TDR contents are transmitted Receive data is inverted before storage in RDR	

Bit 1—Reserved: Read-only bit, always read as 1.

Bit 0—Smart Card Interface Mode Select (SMIF): Enables the smart card interface function.

Bit 0 SMIF	Description	
0	Smart card interface function is disabled	(Initial value)
1	Smart card interface function is enabled	

- Notes:
1. The function for switching between LSB-first and MSB-first mode can also be used with the normal serial communication interface. Note that when the communication format data length is set to 7 bits and MSB-first mode is selected for the serial data to be transferred, bit 0 of TDR is not transmitted, and only bits 7 to 1 of the received data are valid.
 2. The data logic level inversion function can also be used with the normal serial communication interface. Note that, when inverting the serial data to be transferred, parity transmission and parity checking is based on the number of high-level periods at the serial data I/O pin, and not on the register value.

13.2.2 Serial Status Register (SSR)

The function of SSR bit 4 is modified in smart card interface mode. This change also causes a modification to the setting conditions for bit 2 (TEND).

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W

Transmit end
Status flag indicating end
of transmission

Error signal status (ERS)
Status flag indicating that an error
signal has been received

Note: * Only 0 can be written, to clear the flag.

Bits 7 to 5: These bits operate as in normal serial communication. For details see section 12.2.7, Serial Status Register (SSR).

Bit 4—Error Signal Status (ERS): In smart card interface mode, this flag indicates the status of the error signal sent from the receiving device to the transmitting device. The smart card interface does not detect framing errors.

Bit 4

ERS	Description
0	Indicates normal transmission, with no error signal returned (Initial value) [Clearing conditions] <ul style="list-style-type: none"> The chip is reset, or enters standby mode or module stop mode Software reads ERS while it is set to 1, then writes 0.
1	Indicates that the receiving device sent an error signal reporting a parity error [Setting condition] A low error signal was sampled.

Note: Clearing the TE bit to 0 in SCR does not affect the ERS flag, which retains its previous value.

Bits 3 to 0: These bits operate as in normal serial communication. For details see section 12.2.7, Serial Status Register (SSR). The setting conditions for transmit end (TEND), however, are modified as follows.

Bit 2

TEND	Description
0	Transmission is in progress [Clearing condition] Software reads TDRE while it is set to 1, then writes 0 in the TDRE flag.
1	End of transmission [Setting conditions] (Initial value) <ul style="list-style-type: none"> The chip is reset or enters standby mode. The TE bit and FER/ERS bit are both cleared to 0 in SCR. TDRE is 1 and FER/ERS is 0 at a time 2.5 etu after the last bit of a 1-byte serial character is transmitted (normal transmission).

Note: etu: Elementary time unit (time for transfer of 1 bit)

13.2.3 Serial Mode Register (SMR)

The function of SMR bit 7 is modified in smart card interface mode. This change also causes a modification to the function of bits 1 and 0 in the serial control register (SCR).

Bit	7	6	5	4	3	2	1	0
	GM	CHR	PE	O/ \bar{E}	STOP	MP	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 7—GSM Mode (GM): With the normal smart card interface, this bit is cleared to 0. Setting this bit to 1 selects GSM mode, an additional mode for controlling the timing for setting the TEND flag that indicates completion of transmission, and the type of clock output used. The details of the additional clock output control mode are specified by the CKE1 and CKE0 bits in the serial control register (SCR).

Bit 7

GM	Description
0	Normal smart card interface mode operation <ul style="list-style-type: none"> • The TEND flag is set 12.5 etu after the beginning of the start bit. • Clock output on/off control only. (Initial value)
1	GSM mode smart card interface mode operation <ul style="list-style-type: none"> • The TEND flag is set 11.0 etu after the beginning of the start bit. • Clock output on/off and fixed-high/fixed-low control.

Bits 6 to 0: These bits operate as in normal serial communication. For details see section 12.2.5, Serial Mode Register (SMR).

13.2.4 Serial Control Register (SCR)

The function of SCR bits 1 and 0 is modified in smart card interface mode.

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 7 to 2: These bits operate as in normal serial communication. For details see section 12.2.6, Serial Control Register (SCR).

Bits 1 and 0—Clock Enable 1 and 0 (CKE1, CKE0): These bits select the SCI clock source and enable or disable clock output from the SCK pin. In smart card interface mode, it is possible to specify a fixed high level or fixed low level for the clock output, in addition to the usual switching between enabling and disabling of the clock output.

Bit 7 GM	Bit 1 CKE1	Bit 0 CKE0	Description
0	0	0	Internal clock/SCK pin is I/O port (Initial value)
		1	Internal clock/SCK pin is clock output
1	1	0	Internal clock/SCK pin is fixed at low output
		1	Internal clock/SCK pin is clock output
		0	Internal clock/SCK pin is fixed at high output
		1	Internal clock/SCK pin is clock output

13.3 Operation

13.3.1 Overview

The main features of the smart card interface are as follows.

- One frame consists of 8-bit data plus a parity bit.
- In transmission, a guard time of at least 2 etu (elementary time units: time for transfer of 1 bit) is provided between the end of the parity bit and the start of the next frame.
- If a parity error is detected during reception, a low error signal level is output for 1 etu period 10.5 etu after the start bit.
- If an error signal is detected during transmission, the same data is transmitted automatically after the elapse of 2 etu or longer.
- Only asynchronous communication is supported; there is no synchronous communication function.

13.3.2 Pin Connections

Figure 13.2 shows a pin connection diagram for the smart card interface.

In communication with a smart card, since both transmission and reception are carried out on a single data transmission line, the TxD pin and RxD pin should both be connected to this line. The data transmission line should be pulled up to V_{CC} with a resistor.

When the smart card uses the clock generated on the smart card interface, the SCK pin output is input to the CLK pin of the smart card. If the smart card uses an internal clock, this connection is unnecessary.

The reset signal should be output from one of the H8/3062 Group's generic ports.

In addition to these pin connections, power and ground connections will normally also be necessary.

Figure 13.2 Smart Card Interface Connection Diagram

Note: Setting both TE and RE to 1 without connecting a smart card enables closed transmission/reception, allowing self-diagnosis to be carried out.

13.3.3 Data Format

Figure 13.3 shows the smart card interface data format. In reception in this mode, a parity check is carried out on each frame, and if an error is detected an error signal is sent back to the transmitting device to request retransmission of the data. In transmission, the error signal is sampled and the same data is retransmitted.

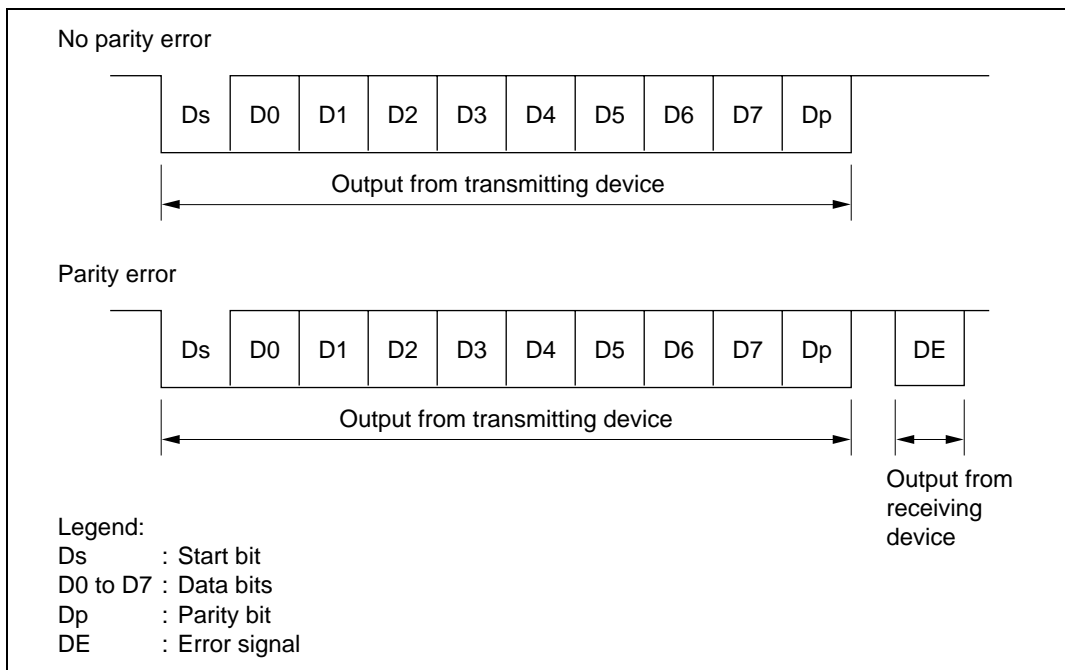

Figure 13.3 Smart Card Interface Data Format

The operating sequence is as follows.

1. When the data line is not in use it is in the high-impedance state, and is fixed high with a pull-up resistor.
2. The transmitting device starts transfer of one frame of data. The data frame starts with a start bit (Ds, low-level), followed by 8 data bits (D0 to D7) and a parity bit (Dp).
3. With the smart card interface, the data line then returns to the high-impedance state. The data line is pulled high with a pull-up resistor.
4. The receiving device carries out a parity check. If there is no parity error and the data is received normally, the receiving device waits for reception of the next data. If a parity error occurs, however, the receiving device outputs an error signal (DE, low-level) to request retransmission of the data. After outputting the error signal for the prescribed length of time, the receiving device places the signal line in the high-impedance state again. The signal line is pulled high again by a pull-up resistor.
5. If the transmitting device does not receive an error signal, it proceeds to transmit the next data frame. If it receives an error signal, however, it returns to step 2 and transmits the same data again.

13.3.4 Register Settings

Table 13.3 shows a bit map of the registers used in the smart card interface. Bits indicated as 0 or 1 must be set to the value shown. The setting of other bits is described in this section.

Table 13.3 Smart Card Interface Register Settings

Register	Address*1	Bit							
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SMR	H'FFFB0	GM	0	1	O/E	1	0	CKS1	CKS0
BRR	H'FFFB1	BRR7	BRR6	BRR5	BRR4	BRR3	BRR2	BRR1	BRR0
SCR	H'FFFB2	TIE	RIE	TE	RE	0	0	CKE1*2	CKE0
TDR	H'FFFB3	TDR7	TDR6	TDR5	TDR4	TDR3	TDR2	TDR1	TDR0
SSR	H'FFFB4	TDRE	RDRF	ORER	ERS	PER	TEND	0	0
RDR	H'FFFB5	RDR7	RDR6	RDR5	RDR4	RDR3	RDR2	RDR1	RDR0
SCMR	H'FFFB6	—	—	—	—	SDIR	SINV	—	SMIF

Notes: —: Unused bit.

1. Lower 20 bits of the address in advanced mode
2. When GM is cleared to 0 in SMR, the CKE1 bit must also be cleared to 0.

Serial Mode Register (SMR) Settings: Clear the GM bit to 0 when using the normal smart card interface mode, or set to 1 when using GSM mode. Clear the O/ \bar{E} bit to 0 if the smart card is of the direct convention type, or set to 1 if of the inverse convention type.

Bits CKS1 and CKS0 select the clock source of the built-in baud rate generator. See section 13.3.5, Clock.

Bit Rate Register (BRR) Settings: BRR is used to set the bit rate. See section 13.3.5, Clock, for the method of calculating the value to be set.

Serial Control Register (SCR) Settings: The TIE, RIE, TE, and RE bits have their normal serial communication functions. See section 12, Serial Communication Interface, for details. The CKE1 and CKE0 bits specify clock output. To disable clock output, clear these bits to 00; to enable clock output, set these bits to 01. Clock output is performed when the GM bit is set to 1 in SMR. Clock output can also be fixed low or high.

Smart Card Mode Register (SCMR) Settings: Clear both the SDIR bit and SINV bit cleared to 0 if the smart card is of the direct convention type, and set both to 1 if of the inverse convention type. To use the smart card interface, set the SMIF bit to 1.

The register settings and examples of starting character waveforms are shown below for two smart cards, one following the direct convention and one the inverse convention.

1. Direct Convention ($SDIR = SINV = O/\bar{E} = 0$)

With the direct convention type, the logic 1 level corresponds to state Z and the logic 0 level to state A, and transfer is performed in LSB-first order. In the example above, the first character data is H'3B. The parity bit is 1, following the even parity rule designated for smart cards.

2. Inverse Convention ($SDIR = SINV = O/\bar{E} = 1$)

With the inverse convention type, the logic 1 level corresponds to state A and the logic 0 level to state Z, and transfer is performed in MSB-first order. In the example above, the first character data is H'3F. The parity bit is 0, corresponding to state Z, following the even parity rule designated for smart cards.

In the H8/3062 Group, inversion specified by the SINV bit applies only to the data bits, D7 to D0. For parity bit inversion, the O/\bar{E} bit in SMR must be set to odd parity mode. This applies to both transmission and reception.

13.3.5 Clock

Only an internal clock generated by the on-chip baud rate generator can be used as the transmit/receive clock for the smart card interface. The bit rate is set with the bit rate register (BRR) and the CKS1 and CKS0 bits in the serial mode register (SMR). The equation for calculating the bit rate is shown below. Table 13.5 shows some sample bit rates.

If clock output is selected with CKE0 set to 1, a clock with a frequency of 372 times the bit rate is output from the SCK pin.

$$B = \frac{\phi}{1488 \times 2^{2n-1} \times (N + 1)} \times 10^6$$

where, N: BRR setting ($0 \leq N \leq 255$)

B: Bit rate (bit/s)

ϕ : Operating frequency (MHz)

n: See table 13.4

Table 13.4 n-Values of CKS1 and CKS0 Settings

n	CKS1	CKS0
0	0	0
1		1
2	1	0
3		1

Note: If the gear function is used to divide the clock frequency, use the divided frequency to calculate the bit rate. The equation above applies directly to 1/1 frequency division.

Table 13.5 Bit Rates (bits/s) for Various BRR Settings (When n = 0)

N	ϕ (MHz)							
	7.1424	10.00	10.7136	13.00	14.2848	16.00	18.00	25.00
0	9600.0	13440.9	14400.0	17473.1	19200.0	21505.4	24193.5	33602.2
1	4800.0	6720.4	7200.0	8736.6	9600.0	10752.7	12096.8	16801.1
2	3200.0	4480.3	4800.0	5824.4	6400.0	7168.5	8064.5	11200.7

Note: Bit rates are rounded off to two decimal places.

The following equation calculates the bit rate register (BRR) setting from the operating frequency and bit rate. N is an integer from 0 to 255, specifying the value with the smaller error.

$$N = \frac{\phi}{1488 \times 2^{2n-1} \times B} \times 10^6 - 1$$

Table 13.6 BRR Settings for Typical Bit Rates (bits/s) (When n = 0)

bit/s	ϕ (MHz)															
	7.1424		10.00		10.7136		13.00		14.2848		16.00		18.00		25.0	
	N	Error	N	Error	N	Error	N	Error	N	Error	N	Error	N	Error	N	Error
9600	0	0.00	1	30	1	25	1	8.99	1	0.00	1	12.01	2	15.99	3	12.49

Table 13.7 Maximum Bit Rates for Various Frequencies (Smart Card Interface Mode)

ϕ (MHz)	Maximum Bit Rate (bits/s)	N	n
7.1424	9600	0	0
10.00	13441	0	0
10.7136	14400	0	0
13.00	17473	0	0
14.2848	19200	0	0
16.00	21505	0	0
18.00	24194	0	0
20.00	26882	0	0
25.00	33602	0	0

The bit rate error is given by the following equation:

$$\text{Error (\%)} = \left(\frac{\phi}{1488 \times 2^{2n-1} \times B \times (N + 1)} \times 10^6 - 1 \right) \times 100$$

13.3.6 Transmitting and Receiving Data

Initialization: Before transmitting or receiving data, the smart card interface must be initialized as described below. Initialization is also necessary when switching from transmit mode to receive mode, or vice versa.

1. Clear the TE and RE bits to 0 in the serial control register (SCR).
2. Clear error flags ERS, PER, and ORER to 0 in the serial status register (SSR).
3. Set the parity bit (O/\bar{E}) and baud rate generator select bits (CKS1 and CKS0) in the serial mode register (SMR). Clear the C/\bar{A} , CHR, and MP bits to 0, and set the STOP and PE bits to 1.
4. Set the SMIF, SDIR, and SINV bits in the smart card mode register (SCMR).
When the SMIF bit is set to 1, the TxD pin and RxD pin are both switched from port to SCI pin functions and go to the high-impedance state.
5. Set a value corresponding to the desired bit rate in the bit rate register (BRR).
6. Set the CKE0 bit in SCR. Clear the TIE, RIE, TE, RE, MPIE, TEIE, and CKE1 bits to 0. If the CKE0 bit is set to 1, the clock is output from the SCK pin.
7. Wait at least one bit interval, then set the TIE, RIE, TE, and RE bits in SCR. Do not set the TE bit and RE bit at the same time, except for self-diagnosis.

Transmitting Serial Data: As data transmission in smart card mode involves error signal sampling and retransmission processing, the processing procedure is different from that for the normal SCI. Figure 13.5 shows a sample transmission processing flowchart.

1. Perform smart card interface mode initialization as described in Initialization above.
2. Check that the ERS error flag is cleared to 0 in SSR.
3. Repeat steps 2 and 3 until it can be confirmed that the TEND flag is set to 1 in SSR.
4. Write the transmit data in TDR, clear the TDRE flag to 0, and perform the transmit operation.
The TEND flag is cleared to 0.
5. To continue transmitting data, go back to step 2.
6. To end transmission, clear the TE bit to 0.

The above processing may include interrupt handling.

If transmission ends and the TEND flag is set to 1 while the TIE bit is set to 1 and interrupt requests are enabled, a transmit-data-empty interrupt (TXI) will be requested. If an error occurs in transmission and the ERS flag is set to 1 while the RIE bit is set to 1 and interrupt requests are enabled, a transmit/receive-error interrupt (ERI) will be requested.

The timing of TEND flag setting depends on the GM bit in SMR.

Figure 13.4 shows timing of TEND flag setting.

For details, see Interrupt Operations in this section.

Figure 13.4 Timing of TEND Flag Setting

Figure 13.5 Sample Transmission Processing Flowchart

Figure 13.6 Relation Between Transmit Operation and Internal Registers

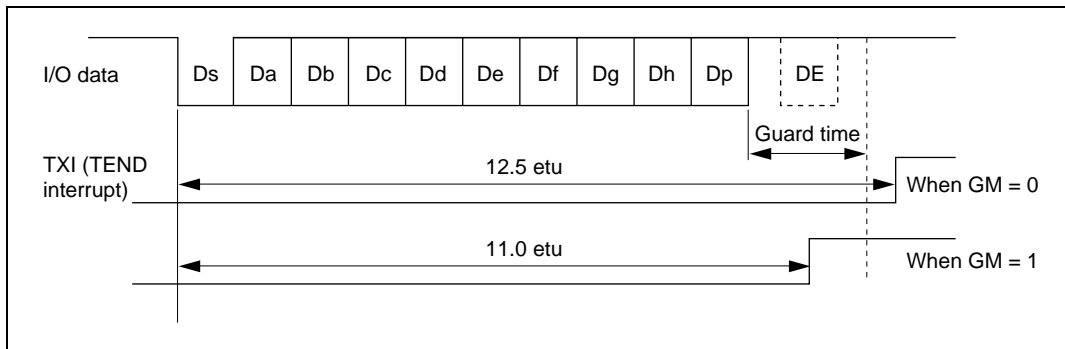

Figure 13.7 Timing of TEND Flag Setting

Receiving Serial Data: Data reception in smart card mode uses the same processing procedure as for the normal SCI. Figure 13.8 shows a sample reception processing flowchart.

1. Perform smart card interface mode initialization as described in Initialization above.
2. Check that the ORER flag and PER flag are cleared to 0 in SSR. If either is set, perform the appropriate receive error handling, then clear both the ORER and the PER flag to 0.
3. Repeat steps 2 and 3 until it can be confirmed that the RDRF flag is set to 1.
4. Read the receive data from RDR.
5. To continue receiving data, clear the RDRF flag to 0 and go back to step 2.
6. To end reception, clear the RE bit to 0.

Figure 13.8 Sample Reception Processing Flowchart

The above procedure may include interrupt handling.

If reception ends and the RDRF flag is set to 1 while the RIE bit is set to 1 and interrupt requests are enabled, a receive-data-full interrupt (RXI) will be requested. If an error occurs in reception and either the ORER flag or the PER flag is set to 1, a transmit/receive-error interrupt (ERI) will be requested.

For details, see Interrupt Operations in this section.

If a parity error occurs during reception and the PER flag is set to 1, the received data is transferred to RDR, so the erroneous data can be read.

Switching Modes: When switching from receive mode to transmit mode, first confirm that the receive operation has been completed, then start from initialization, clearing RE to 0 and setting TE to 1. The RDRF, PER, or ORER flag can be used to check that the receive operation has been completed.

When switching from transmit mode to receive mode, first confirm that the transmit operation has been completed, then start from initialization, clearing TE to 0 and setting RE to 1. The TEND flag can be used to check that the transmit operation has been completed.

Fixing Clock Output: When the GM bit is set to 1 in SMR, clock output can be fixed by means of the CKE1 and CKE0 bits in SCR. The minimum clock pulse width can be set to the specified width in this case.

Figure 13.9 shows the timing for fixing clock output. In this example, GM = 1, CKE1 = 0, and the CKE0 bit is controlled.

Figure 13.9 Timing for Fixing Cock Output

Interrupt Operations: The smart card interface has three interrupt sources: transmit-data-empty (TXI), transmit/receive-error (ERI), and receive-data-full (RXI). The transmit-end interrupt request (TEI) is not available in smart card mode.

A TXI interrupt is requested when the TEND flag is set to 1 in SSR. An RXI interrupt is requested when the RDRF flag is set to 1 in SSR. An ERI interrupt is requested when the ORER, PER, or ERS flag is set to 1 in SSR. These relationships are shown in table 13.8.

Table 13.8 Smart Card Interface Mode Operating States and Interrupt Sources

Operating State		Flag	Enable Bit	Interrupt Source
Transmit Mode	Normal operation	TEND	TIE	TXI
	Error	ERS	RIE	ERI
Receive Mode	Normal operation	RDRF	RIE	RXI
	Error	PER, ORER	RIE	ERI

Examples of Operation in GSM Mode: When switching between smart card interface mode and software standby mode, use the following procedures to maintain the clock duty cycle.

- Switching from smart card interface mode to software standby mode
 1. Set the P9₄ data register (DR) and data direction register (DDR) to the values for the fixed output state in software standby mode.
 2. Write 0 in the TE and RE bits in the serial control register (SCR) to stop transmit/receive operations. At the same time, set the CKE1 bit to the value for the fixed output state in software standby mode.
 3. Write 0 in the CKE0 bit in SCR to stop the clock.
 4. Wait for one serial clock cycle. During this period, the duty cycle is preserved and clock output is fixed at the specified level.
 5. Write H'00 in the serial mode register (SMR) and smart card mode register (SCMR).
 6. Make the transition to the software standby state.

- Returning from software standby mode to smart card interface mode
- 1'. Clear the software standby state.
 - 2'. Set the CKE1 bit in SCR to the value for the fixed output state at the start of software standby (the current P9₄ pin state).
 - 3'. Set smart card interface mode and output the clock. Clock signal generation is started with the normal duty cycle.

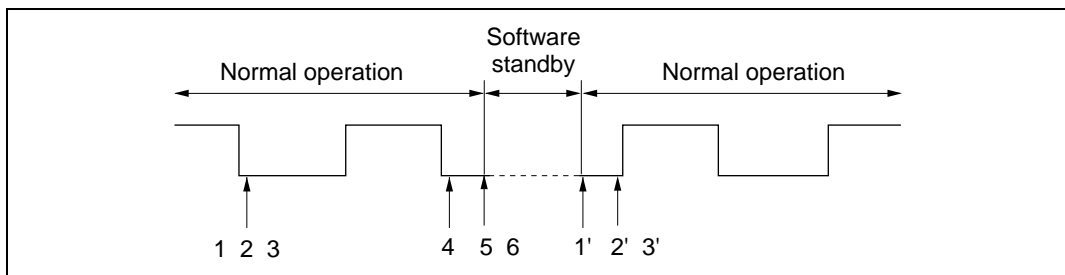

Figure 13.10 Procedure for Stopping and Restarting the Clock

Use the following procedure to secure the clock duty cycle after powering on.

1. The initial state is port input and high impedance. Use pull-up or pull-down resistors to fix the potential.
2. Fix at the output specified by the CKE1 bit in SCR.
3. Set SMR and SCMR, and switch to smart card interface mode operation.
4. Set the CKE0 bit to 1 in SCR to start clock output.

13.4 Usage Notes

The following points should be noted when using the SCI as a smart card interface.

Receive Data Sampling Timing and Receive Margin in Smart Card Interface Mode: In smart card interface mode, the SCI operates on a base clock with a frequency of 372 times the transfer rate. In reception, the SCI synchronizes internally with the fall of the start bit, which it samples on the base clock. Receive data is latched at the rising edge of the 186th base clock pulse. The timing is shown in figure 13.11.

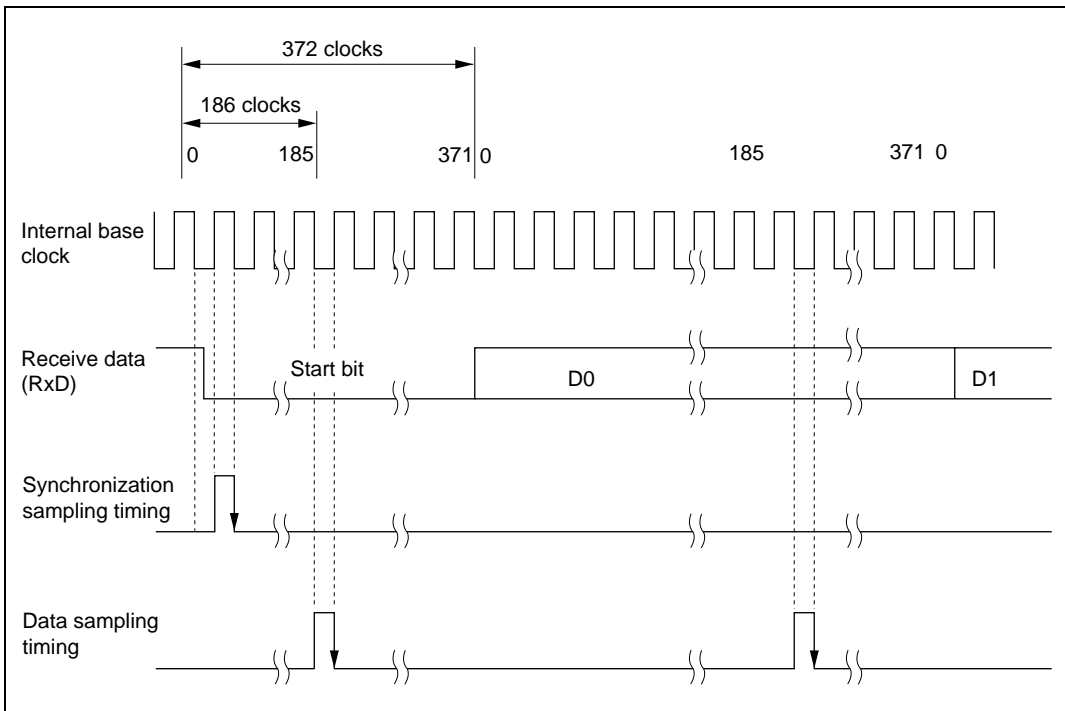

Figure 13.11 Receive Data Sampling Timing in Smart Card Interface Mode

The receive margin can therefore be expressed as follows.

Receive margin in smart card interface mode:

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\%$$

M: Receive margin (%)

N: Ratio of clock frequency to bit rate (N = 372)

D: Clock duty cycle (L = 0 to 1.0)

L: Frame length (L = 10)

F: Absolute deviation of clock frequency

From the above equation, if F = 0 and D = 0.5, the receive margin is as follows.

When D = 0.5 and F = 0:

$$\begin{aligned} M &= (0.5 - 1/2 \times 372) \times 100\% \\ &= 49.866\% \end{aligned}$$

Retransmission: Retransmission is performed by the SCI in receive mode and transmit mode as described below.

- Retransmission when SCI is in Receive Mode

Figure 13.12 illustrates retransmission when the SCI is in receive mode.

1. If an error is found when the received parity bit is checked, the PER bit is automatically set to 1. If the RIE bit in SCR is set to the enable state, an ERI interrupt is requested. The PER bit should be cleared to 0 in SSR before the next parity bit sampling timing.
2. The RDRF bit in SSR is not set for the frame in which the error has occurred.
3. If an error is found when the received parity bit is checked, the PER bit is not set to 1 in SSR.
4. If no error is found when the received parity bit is checked, the receive operation is assumed to have been completed normally, and the RDRF bit is automatically set to 1 in SSR. If the RIE bit in SCR is set to the enable state, an RXI interrupt is requested.
5. When a normal frame is received, the data pin is held in three-state at the error signal transmission timing.

Figure 13.12 Retransmission in SCI Receive Mode

- Retransmission when SCI is in Transmit Mode

Figure 13.13 illustrates retransmission when the SCI is in transmit mode.

6. If an error signal is sent back from the receiving device after transmission of one frame is completed, the ERS bit is set to 1 in SSR. If the RIE bit in SCR is set to the enable state, an ERI interrupt is requested. The ERS bit should be cleared to 0 in SSR before the next parity bit sampling timing.
7. The TEND bit in SSR is not set for the frame for which the error signal was received.
8. If an error signal is not sent back from the receiving device, the ERS flag is not set in SSR.
9. If an error signal is not sent back from the receiving device, transmission of one frame, including retransmission, is assumed to have been completed, and the TEND bit is set to 1 in SSR. If the TIE bit in SCR is set to the enable state, a TXI interrupt is requested.

Figure 13.13 Retransmission in SCI Transmit Mode

The smart card interface installed in the H8/3062 Group supports an IC card (smart card) interface with provision for ISO/IEC7816-3 T=0 (character transmission). Therefore, block transfer operations are not supported (error signal transmission, detection, and automatic data retransmission are not performed).

Section 14 A/D Converter

14.1 Overview

The H8/3062 Group includes a 10-bit successive-approximations A/D converter with a selection of up to eight analog input channels.

When the A/D converter is not used, it can be halted independently to conserve power. For details see section 21.6, Module Standby Function.

The H8/3062 Group supports 70/134-state conversion as a high-speed conversion mode. Note that it differs in this respect from the H8/3048 Group, which supports 134/266-state conversion.

14.1.1 Features

A/D converter features are listed below.

- 10-bit resolution
- Eight input channels
- Selectable analog conversion voltage range
The analog voltage conversion range can be programmed by input of an analog reference voltage at the V_{REF} pin.
- High-speed conversion
Conversion time: minimum 5.36 μ s per channel
- Two conversion modes
Single mode: A/D conversion of one channel
Scan mode: continuous A/D conversion on one to four channels
- Four 16-bit data registers
A/D conversion results are transferred for storage into data registers corresponding to the channels.
- Sample-and-hold function
- Three conversion start sources
The A/D converter can be activated by software, an external trigger, or an 8-bit timer compare match.
- A/D interrupt requested at end of conversion
At the end of A/D conversion, an A/D end interrupt (ADI) can be requested.

14.1.2 Block Diagram

Figure 14.1 shows a block diagram of the A/D converter.

Figure 14.1 A/D Converter Block Diagram

14.1.3 Pin Configuration

Table 14.1 summarizes the A/D converter's input pins. The eight analog input pins are divided into two groups: group 0 (AN₀ to AN₃), and group 1 (AN₄ to AN₇). AV_{CC} and AV_{SS} are the power supply for the analog circuits in the A/D converter. V_{REF} is the A/D conversion reference voltage.

Table 14.1 A/D Converter Pins

Pin Name	Abbreviation	I/O	Function
Analog power supply pin	AV _{CC}	Input	Analog power supply
Analog ground pin	AV _{SS}	Input	Analog ground and reference voltage
Reference voltage pin	V _{REF}	Input	Analog reference voltage
Analog input pin 0	AN ₀	Input	Group 0 analog inputs
Analog input pin 1	AN ₁	Input	
Analog input pin 2	AN ₂	Input	
Analog input pin 3	AN ₃	Input	
Analog input pin 4	AN ₄	Input	Group 1 analog inputs
Analog input pin 5	AN ₅	Input	
Analog input pin 6	AN ₆	Input	
Analog input pin 7	AN ₇	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input for starting A/D conversion

14.1.4 Register Configuration

Table 14.2 summarizes the A/D converter's registers.

Table 14.2 A/D Converter Registers

Address*1	Name	Abbreviation	R/W	Initial Value
H'FFFE0	A/D data register A H	ADDRAH	R	H'00
H'FFFE1	A/D data register A L	ADDRAL	R	H'00
H'FFFE2	A/D data register B H	ADDRBH	R	H'00
H'FFFE3	A/D data register B L	ADDRBL	R	H'00
H'FFFE4	A/D data register C H	ADDRCH	R	H'00
H'FFFE5	A/D data register C L	ADDRCL	R	H'00
H'FFFE6	A/D data register D H	ADDRDH	R	H'00
H'FFFE7	A/D data register D L	ADDRDL	R	H'00
H'FFFE8	A/D control/status register	ADCSR	R/(W)*2	H'00
H'FFFE9	A/D control register	ADCR	R/W	H'7E

- Notes: 1. Lower 20 bits of the address in advanced mode
 2. Only 0 can be written in bit 7, to clear the flag.

14.2 Register Descriptions

14.2.1 A/D Data Registers A to D (ADDRA to ADDR D)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR _n	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write (n = A to D)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
	A/D conversion data 10-bit data giving an A/D conversion result										Reserved bits					

The four A/D data registers (ADDRA to ADDR D) are 16-bit read-only registers that store the results of A/D conversion.

An A/D conversion produces 10-bit data, which is transferred for storage into the A/D data register corresponding to the selected channel. The upper 8 bits of the result are stored in the upper byte of the A/D data register. The lower 2 bits are stored in the lower byte. Bits 5 to 0 of an A/D data register are reserved bits that are always read as 0. Table 14.3 indicates the pairings of analog input channels and A/D data registers.

The CPU can always read and write the A/D data registers. The upper byte can be read directly, but the lower byte is read through a temporary register (TEMP). For details see section 14.3, CPU Interface.

The A/D data registers are initialized to H'0000 by a reset and in standby mode.

Table 14.3 Analog Input Channels and A/D Data Registers (ADDRA to ADDR D)

Analog Input Channel		
Group 0	Group 1	A/D Data Register
AN ₀	AN ₄	ADDRA
AN ₁	AN ₅	ADDRB
AN ₂	AN ₆	ADDRC
AN ₃	AN ₇	ADDRD

14.2.2 A/D Control/Status Register (ADCSR)

Bit	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	SCAN	CKS	CH2	CH1	CH0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A/D end flag
 Indicates end of A/D conversion

A/D interrupt enable
 Enables and disables A/D end interrupts

A/D start
 Starts or stops A/D conversion

Scan mode
 Selects single mode or scan mode

Clock select
 Selects the A/D conversion time

Channel select 2 to 0
 These bits select analog input channels

Note: * Only 0 can be written, to clear the flag.

ADCSR is an 8-bit readable/writable register that selects the mode and controls the A/D converter. ADCSR is initialized to H'00 by a reset and in standby mode.

Bit 7—A/D End Flag (ADF): Indicates the end of A/D conversion.

Bit 7 ADF	Description
0	[Clearing condition] Read ADF when ADF =1, then write 0 in ADF. (Initial value)
1	[Setting conditions] <ul style="list-style-type: none"> • Single mode: A/D conversion ends • Scan mode: A/D conversion ends in all selected channels

Bit 6—A/D Interrupt Enable (ADIE): Enables or disables the interrupt (ADI) requested at the end of A/D conversion.

Bit 6 ADIE	Description	
0	A/D end interrupt request (ADI) is disabled	(Initial value)
1	A/D end interrupt request (ADI) is enabled	

Bit 5—A/D Start (ADST): Starts or stops A/D conversion. The ADST bit remains set to 1 during A/D conversion. It can also be set to 1 by external trigger input at the $\overline{\text{ADTRG}}$ pin, or by an 8-bit timer compare match.

Bit 5 ADST	Description	
0	A/D conversion is stopped	(Initial value)
1	Single mode: A/D conversion starts; ADST is automatically cleared to 0 when conversion ends. Scan mode: A/D conversion starts and continues, cycling among the selected channels, until ADST is cleared to 0 by software, by a reset, or by a transition to standby mode.	

Bit 4—Scan Mode (SCAN): Selects single mode or scan mode. For further information on operation in these modes, see section 14.4, Operation. Clear the ADST bit to 0 before switching the conversion mode.

Bit 4 SCAN	Description	
0	Single mode	(Initial value)
1	Scan mode	

Bit 3—Clock Select (CKS): Selects the A/D conversion time. Clear the ADST bit to 0 before switching the conversion time.

Bit 3 CKS	Description	
0	Conversion time = 134 states (maximum)	(Initial value)
1	Conversion time = 70 states (maximum)	

Bits 2 to 0—Channel Select 2 to 0 (CH2 to CH0): These bits and the SCAN bit select the analog input channels. Clear the ADST bit to 0 before changing the channel selection.

Group Selection	Channel Selection		Description	
	CH1	CH0	Single Mode	Scan Mode
0	0	0	AN ₀ (Initial value)	AN ₀
		1	AN ₁	AN ₀ , AN ₁
	1	0	AN ₂	AN ₀ to AN ₂
		1	AN ₃	AN ₀ to AN ₃
1	0	0	AN ₄	AN ₄
		1	AN ₅	AN ₄ , AN ₅
	1	0	AN ₆	AN ₄ to AN ₆
		1	AN ₇	AN ₄ to AN ₇

14.2.3 A/D Control Register (ADCR)

Bit	7	6	5	4	3	2	1	0
	TRGE	—	—	—	—	—	—	—
Initial value	0	1	1	1	1	1	1	0
Read/Write	R/W	—	—	—	—	—	—	R/W

Reserved bits

Trigger enable
Enables or disables starting of A/D conversion by an external trigger or 8-bit timer compare match

ADCR is an 8-bit readable/writable register that enables or disables starting of A/D conversion by external trigger input or an 8-bit timer compare match signal. ADCR is initialized to H'7F by a reset and in standby mode.

Bit 7—Trigger Enable (TRGE): Enables or disables starting of A/D conversion by an external trigger or 8-bit timer compare match.

Bit 7 TRGE	Description
0	Starting of A/D conversion by an external trigger or 8-bit timer compare match is disabled (Initial value)
1	A/D conversion is started at the falling edge of the external trigger signal ($\overline{\text{ADTRG}}$) or by an 8-bit timer compare match

External trigger pin and 8-bit timer selection is performed by the 8-bit timer. For details, see section 9, 8-Bit Timers.

Bits 6 to 1—Reserved: These bits cannot be modified and are always read as 1.

Bit 0—Reserved: This bit can be read or written, but must not be set to 1.

14.3 CPU Interface

ADDRA to ADDRD are 16-bit registers, but they are connected to the CPU by an 8-bit data bus. Therefore, although the upper byte can be accessed directly by the CPU, the lower byte is read through an 8-bit temporary register (TEMP).

An A/D data register is read as follows. When the upper byte is read, the upper-byte value is transferred directly to the CPU and the lower-byte value is transferred into TEMP. Next, when the lower byte is read, the TEMP contents are transferred to the CPU.

When reading an A/D data register, always read the upper byte before the lower byte. It is possible to read only the upper byte, but if only the lower byte is read, incorrect data may be obtained.

Figure 14.2 shows the data flow for access to an A/D data register.

Figure 14.2 A/D Data Register Access Operation (Reading H'AA40)

14.4 Operation

The A/D converter operates by successive approximations with 10-bit resolution. It has two operating modes: single mode and scan mode.

14.4.1 Single Mode (SCAN = 0)

Single mode should be selected when only one A/D conversion on one channel is required. A/D conversion starts when the ADST bit is set to 1 by software, or by external trigger input. The ADST bit remains set to 1 during A/D conversion and is automatically cleared to 0 when conversion ends.

When conversion ends the ADF flag is set to 1. If the ADIE bit is also set to 1, an ADI interrupt is requested at this time. To clear the ADF flag to 0, first read ADCSR, then write 0 in ADF.

When the mode or analog input channel must be switched during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel is changed.

Typical operations when channel 1 (AN_1) is selected in single mode are described next.

Figure 14.3 shows a timing diagram for this example.

1. Single mode is selected (SCAN = 0), input channel AN_1 is selected (CH2 = CH1 = 0, CH0 = 1), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the result is transferred into ADDR0. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADCSR, then writes 0 in the ADF flag.
6. The routine reads and processes the conversion result (ADDR0).
7. Execution of the A/D interrupt handling routine ends. After that, if the ADST bit is set to 1, A/D conversion starts again and steps 2 to 7 are repeated.

Figure 14.3 Example of A/D Converter Operation (Single Mode, Channel 1 Selected)

14.4.2 Scan Mode (SCAN = 1)

Scan mode is useful for monitoring analog inputs in a group of one or more channels. When the ADST bit is set to 1 by software or external trigger input, A/D conversion starts on the first channel in the group (AN₀ when CH2 = 0, AN₄ when CH2 = 1). When two or more channels are selected, after conversion of the first channel ends, conversion of the second channel (AN₁ or AN₅) starts immediately. A/D conversion continues cyclically on the selected channels until the ADST bit is cleared to 0. The conversion results are transferred for storage into the A/D data registers corresponding to the channels.

When the mode or analog input channel selection must be changed during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels in group 0 (AN₀ to AN₂) are selected in scan mode are described next. Figure 14.4 shows a timing diagram for this example.

1. Scan mode is selected (SCAN = 1), scan group 0 is selected (CH2 = 0), analog input channels AN₀ to AN₂ are selected (CH1 = 1, CH0 = 0), and A/D conversion is started (ADST = 1).
2. When A/D conversion of the first channel (AN₀) is completed, the result is transferred into ADDRA. Next, conversion of the second channel (AN₁) starts automatically.
3. Conversion proceeds in the same way through the third channel (AN₂).
4. When conversion of all selected channels (AN₀ to AN₂) is completed, the ADF flag is set to 1 and conversion of the first channel (AN₀) starts again. If the ADIE bit is set to 1, an ADI interrupt is requested when A/D conversion ends.
5. Steps 2 to 4 are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion stops. After that, if the ADST bit is set to 1, A/D conversion starts again from the first channel (AN₀).

Figure 14.4 Example of A/D Converter Operation (Scan Mode, Channels AN₀ to AN₂ Selected)

14.4.3 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at a time t_D after the ADST bit is set to 1, then starts conversion. Figure 14.5 shows the A/D conversion timing. Table 14.4 indicates the A/D conversion time.

As indicated in figure 14.5, the A/D conversion time includes t_D and the input sampling time. The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in table 14.4.

In scan mode, the values given in table 14.4 apply to the first conversion. In the second and subsequent conversions the conversion time is fixed at 128 states when $CKS = 0$ or 66 states when $CKS = 1$.

Figure 14.5 A/D Conversion Timing

Table 14.4 A/D Conversion Time (Single Mode)

	Symbol	CKS = 0			CKS = 1		
		Min	Typ	Max	Min	Typ	Max
Synchronization delay	t_D	6	—	9	4	—	5
Input sampling time	t_{SPL}	—	31	—	—	15	—
A/D conversion time	t_{CONV}	131	—	134	69	—	70

Note: Values in the table are numbers of states.

14.4.4 External Trigger Input Timing

A/D conversion can be externally triggered. When the TRGE bit is set to 1 in ADCR and the 8-bit timer's ADTE bit is cleared to 0, external trigger input is enabled at the \overline{ADTRG} pin. A high-to-low transition at the \overline{ADTRG} pin sets the ADST bit to 1 in ADCSR, starting A/D conversion. Other operations, in both single and scan modes, are the same as if the ADST bit had been set to 1 by software. Figure 14.6 shows the timing.

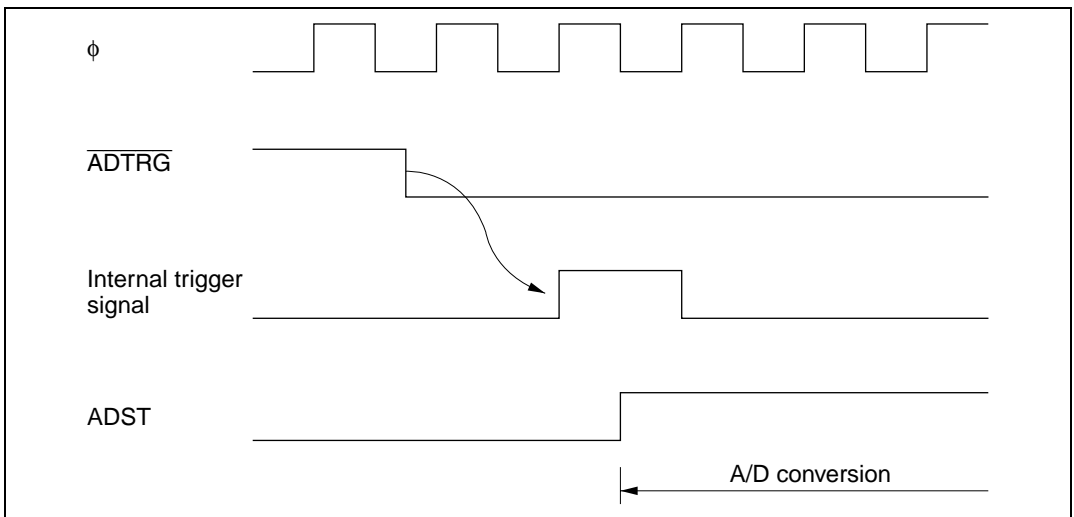

Figure 14.6 External Trigger Input Timing

14.5 Interrupts

The A/D converter generates an interrupt (ADI) at the end of A/D conversion. The ADI interrupt request can be enabled or disabled by the ADIE bit in ADCSR.

14.6 Usage Notes

When using the A/D converter, note the following points:

1. Analog Input Voltage Range

During A/D conversion, the voltages input to the analog input pins AN_n should be in the range $AV_{SS} \leq AN_n \leq V_{REF}$.

2. Relationships of AV_{CC} and AV_{SS} to V_{CC} and V_{SS}

AV_{CC} , AV_{SS} , V_{CC} , and V_{SS} should be related as follows: $AV_{SS} = V_{SS}$. AV_{CC} and AV_{SS} must not be left open, even if the A/D converter is not used.

3. V_{REF} Programming Range

The reference voltage input at the V_{REF} pin should be in the range $V_{REF} \leq AV_{CC}$.

4. Note on Board Design

In board layout, separate the digital circuits from the analog circuits as much as possible. Particularly avoid layouts in which the signal lines of digital circuits cross or closely approach the signal lines of analog circuits. Induction and other effects may cause the analog circuits to operate incorrectly, or may adversely affect the accuracy of A/D conversion.

The analog input signals (AN_0 to AN_7), analog reference voltage (V_{REF}), and analog supply voltage (AV_{CC}) must be separated from digital circuits by the analog ground (AV_{SS}). The analog ground (AV_{SS}) should be connected to a stable digital ground (V_{SS}) at one point on the board.

5. Note on Noise

To prevent damage from surges and other abnormal voltages at the analog input pins (AN_0 to AN_7) and analog reference voltage pin (V_{REF}), connect a protection circuit like the one in figure 14.7 between AV_{CC} and AV_{SS} . The bypass capacitors connected to AV_{CC} and V_{REF} and the filter capacitors connected to AN_0 to AN_7 must be connected to AV_{SS} . If filter capacitors like the ones in figure 14.7 are connected, the voltage values input to the analog input pins (AN_0 to AN_7) will be smoothed, which may give rise to error. Error can also occur if A/D conversion is frequently performed in scan mode so that the current that charges and discharges the capacitor in the sample-and-hold circuit of the A/D converter becomes greater

than that input to the analog input pins via input impedance (R_{in}). The circuit constants should therefore be selected carefully.

Figure 14.7 Example of Analog Input Protection Circuit

Table 14.5 Analog Input Pin Ratings

Item	Min	Max	Unit
Analog input capacitance	—	20	pF
Allowable signal-source impedance	—	10*	k Ω

Note: * When conversion time = 134 states, $V_{CC} = 4.0 \text{ V to } 5.5 \text{ V}$, and $\phi \leq 13 \text{ MHz}$. For details, see section 22. Electrical Characteristics.

Figure 14.8 Analog Input Pin Equivalent Circuit

Note: Numeric values are approximate, except in table 14.5.

6. A/D Conversion Accuracy Definitions

A/D conversion accuracy in the H8/3062 Group is defined as follows:

- Resolution
Digital output code length of A/D converter
- Offset error
Deviation from ideal A/D conversion characteristic of analog input voltage required to raise digital output from minimum voltage value 0000000000 to 0000000001 (figure 14.10)
- Full-scale error
Deviation from ideal A/D conversion characteristic of analog input voltage required to raise digital output from 1111111110 to 1111111111 (figure 14.10)
- Quantization error
Intrinsic error of the A/D converter; 1/2 LSB (figure 14.9)
- Nonlinearity error
Deviation from ideal A/D conversion characteristic in range from zero volts to full scale, exclusive of offset error, full-scale error, and quantization error.
- Absolute accuracy
Deviation of digital value from analog input value, including offset error, full-scale error, quantization error, and nonlinearity error.

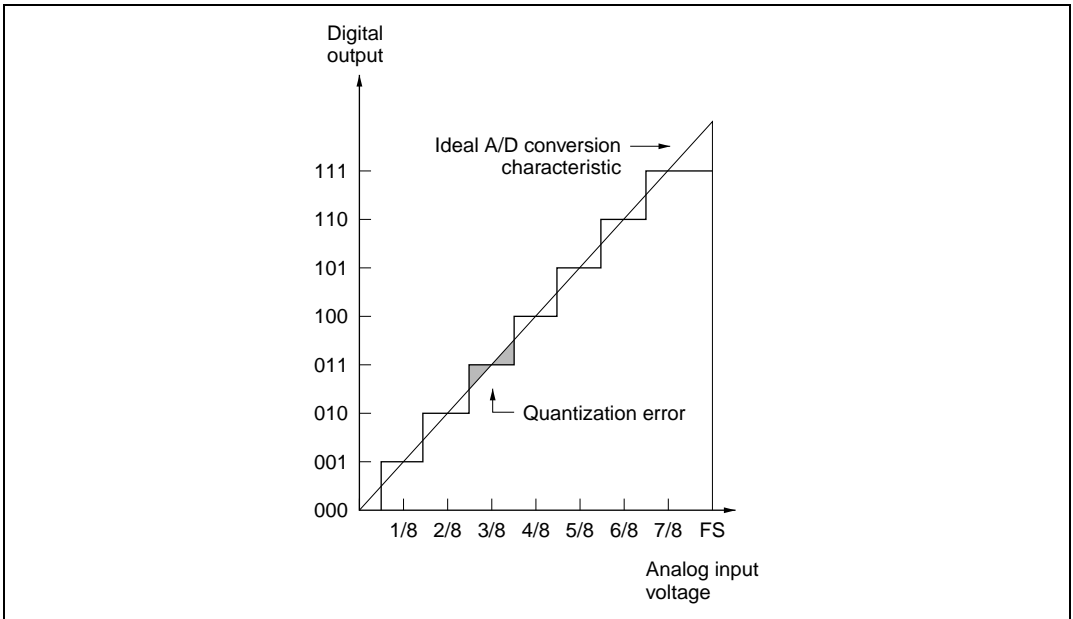

Figure 14.9 A/D Converter Accuracy Definitions (1)

Figure 14.10 A/D Converter Accuracy Definitions (2)

7. Allowable Signal-Source Impedance

The analog inputs of the H8/3062 Group are designed to assure accurate conversion of input signals with a signal-source impedance not exceeding 10 k Ω . The reason for this rating is that it enables the input capacitor in the sample-and-hold circuit in the A/D converter to charge within the sampling time. If the sensor output impedance exceeds 10 k Ω , charging may be inadequate and the accuracy of A/D conversion cannot be guaranteed.

If a large external capacitor is provided in single mode, then the internal 10-k Ω input resistance becomes the only significant load on the input. In this case the impedance of the signal source is not a problem.

A large external capacitor, however, acts as a low-pass filter. This may make it impossible to track analog signals with high dv/dt (e.g. a variation of 5 mV/ μ s) (figure 14.11). To convert high-speed analog signals or to use scan mode, insert a low-impedance buffer.

8. Effect on Absolute Accuracy

Attaching an external capacitor creates a coupling with ground, so if there is noise on the ground line, it may degrade absolute accuracy. The capacitor must be connected to an electrically stable ground, such as AV_{SS}.

If a filter circuit is used, be careful of interference with digital signals on the same board, and make sure the circuit does not act as an antenna.

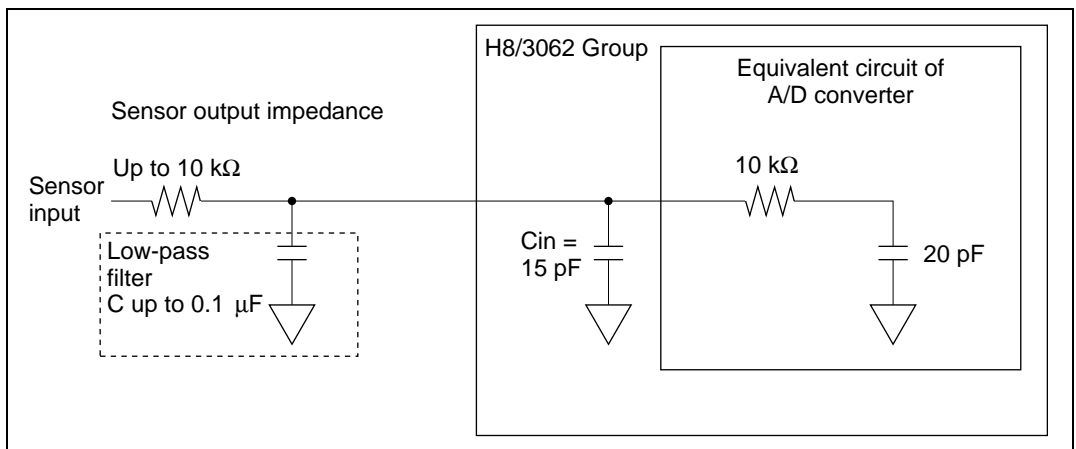

Figure 14.11 Analog Input Circuit (Example)

Section 15 D/A Converter

15.1 Overview

The H8/3062 Group includes a D/A converter with two channels.

15.1.1 Features

D/A converter features are listed below.

- Eight-bit resolution
- Two output channels
- Conversion time: maximum 10 μ s (with 20-pF capacitive load)
- Output voltage: 0 V to V_{REF}
- D/A outputs can be sustained in software standby mode

15.1.2 Block Diagram

Figure 15.1 shows a block diagram of the D/A converter.

Figure 15.1 D/A Converter Block Diagram

15.1.3 Pin Configuration

Table 15.1 summarizes the D/A converter's input and output pins.

Table 15.1 D/A Converter Pins

Pin Name	Abbreviation	I/O	Function
Analog power supply pin	AV_{SS}	Input	Analog power supply and reference voltage
Analog ground pin	AV_{SS}	Input	Analog ground and reference voltage
Analog output pin 0	DA_0	Output	Analog output, channel 0
Analog output pin 1	DA_1	Output	Analog output, channel 1
Reference voltage input pin	V_{REF}	Input	Analog reference voltage

15.1.4 Register Configuration

Table 15.2 summarizes the D/A converter's registers.

Table 15.2 D/A Converter Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF9C	D/A data register 0	DADR0	R/W	H'00
H'FFF9D	D/A data register 1	DADR1	R/W	H'00
H'FFF9E	D/A control register	DACR	R/W	H'1F
H'EE01A	D/A standby control register	DASTCR	R/W	H'FE

Note: * Lower 20 bits of the address in advanced mode

15.2 Register Descriptions

15.2.1 D/A Data Registers 0 and 1 (DADR0, DADR1)

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The D/A data registers (DADR0 and DADR1) are 8-bit readable/writable registers that store the data to be converted. When analog output is enabled, the D/A data register values are constantly converted and output at the analog output pins.

The D/A data registers are initialized to H'00 by a reset and in standby mode.

When the DASTE bit is set to 1 in the D/A standby control register (DASTCR), the D/A registers are not initialized in software standby mode.

15.2.2 D/A Control Register (DACR)

Bit	7	6	5	4	3	2	1	0
	DAOE1	DAOE0	DAE	—	—	—	—	—
Initial value	0	0	0	1	1	1	1	1
Read/Write	R/W	R/W	R/W	—	—	—	—	—

D/A enable
 Controls D/A conversion

D/A output enable 0
 Controls D/A conversion and analog output

D/A output enable 1
 Controls D/A conversion and analog output

DACR is an 8-bit readable/writable register that controls the operation of the D/A converter. DACR is initialized to H'1F by a reset and in standby mode.

When the DASTE bit is set to 1 in the D/A standby control register (DASTCR), the D/A registers are not initialized in software standby mode.

Bit 7—D/A Output Enable 1 (DAOE1): Controls D/A conversion and analog output.

Bit 7

DAOE1	Description
0	DA ₁ analog output is disabled
1	Channel-1 D/A conversion and DA ₁ analog output are enabled

Bit 6—D/A Output Enable 0 (DAOE0): Controls D/A conversion and analog output.

Bit 6

DAOE0	Description
0	DA ₀ analog output is disabled
1	Channel-0 D/A conversion and DA ₀ analog output are enabled

Bit 5—D/A Enable (DAE): Controls D/A conversion, together with bits DAOE0 and DAOE1.

When the DAE bit is cleared to 0, analog conversion is controlled independently in channels 0 and 1. When the DAE bit is set to 1, analog conversion is controlled together in channels 0 and 1. Output of the conversion results is always controlled independently by DAOE0 and DAOE1.

Bit 7 DAOE1	Bit 6 DAOE0	Bit 5 DAE	Description
0	0	—	D/A conversion is disabled in channels 0 and 1
0	1	0	D/A conversion is enabled in channel 0 D/A conversion is disabled in channel 1
0	1	1	D/A conversion is enabled in channels 0 and 1
1	0	0	D/A conversion is disabled in channel 0 D/A conversion is enabled in channel 1
1	0	1	D/A conversion is enabled in channels 0 and 1
1	1	—	D/A conversion is enabled in channels 0 and 1

When the DAE bit is set to 1, even if bits DAOE0 and DAOE1 in DACR and the ADST bit in ADCSR are cleared to 0, the same current is drawn from the analog power supply as during A/D and D/A conversion.

Bits 4 to 0—Reserved: These bits cannot be modified and are always read as 1.

15.2.3 D/A Standby Control Register (DASTCR)

DASTCR is an 8-bit readable/writable register that enables or disables D/A output in software standby mode.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DASTE
Initial value	1	1	1	1	1	1	1	0
Read/Write	—	—	—	—	—	—	—	R/W

Reserved bits

D/A standby enable
Enables or disables D/A output
in software standby mode

DASTCR is initialized to H'FE by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 1—Reserved: These bits cannot be modified and are always read as 1.

Bit 0—D/A Standby Enable (DASTE): Enables or disables D/A output in software standby mode.

Bit 0

DASTE	Description	
0	D/A output is disabled in software standby mode	(Initial value)
1	D/A output is enabled in software standby mode	

15.3 Operation

The D/A converter has two built-in D/A conversion circuits that can perform conversion independently.

D/A conversion is performed constantly while enabled in DACR. If the DADR0 or DADR1 value is modified, conversion of the new data begins immediately. The conversion results are output when bits DAOE0 and DAOE1 are set to 1.

An example of D/A conversion on channel 0 is given next. Timing is indicated in figure 15.2.

1. Data to be converted is written in DADR0.
2. Bit DAOE0 is set to 1 in DACR. D/A conversion starts and DA₀ becomes an output pin. The converted result is output after the conversion time.

$$\text{The output value is } \frac{\text{DADR contents}}{256} \times V_{\text{REF}}$$

Output of this conversion result continues until the value in DADR0 is modified or the DAOE0 bit is cleared to 0.

3. If the DADR0 value is modified, conversion starts immediately, and the result is output after the conversion time.
4. When the DAOE0 bit is cleared to 0, DA0 becomes an input pin.

Figure 15.2 Example of D/A Converter Operation

15.4 D/A Output Control

In the H8/3062 Group, D/A converter output can be enabled or disabled in software standby mode.

When the DASTE bit is set to 1 in DASTCR, D/A converter output is enabled in software standby mode. The D/A converter registers retain the values they held prior to the transition to software standby mode.

When D/A output is enabled in software standby mode, the reference supply current is the same as during normal operation.

Section 16 RAM

16.1 Overview

The H8/3062 Group has high-speed static RAM on-chip. The RAM is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, making the RAM useful for rapid data transfer.

The on-chip RAM can be enabled or disabled with the RAM enable bit (RAME) in the system control register (SYSCR). When the on-chip RAM is disabled, that area is assigned to external space in the expanded modes. The on-chip RAM specifications for the product lineup are shown in table 16.1.

Table 16.1 H8/3062 Group On-Chip RAM Specifications

		H8/3062 F-ZTAT R-Mask Version	H8/3062 F-ZTAT B-Mask Version	H8/3062 Masked ROM Version, H8/3062 Masked ROM B-Mask Version	H8/3061 Masked ROM Version, H8/3061 Masked ROM B-Mask Version	H8/3060 Masked ROM Version, H8/3060 Masked ROM B-Mask Version	H8/3064 F-ZTAT B-Mask Version	H8/3064 Masked ROM B-Mask Version

RAM enable bit
 Enables or disables on-chip RAM

Software standby output port enable

NMI edge select

User bit enable

Standby timer select 2 to 0

Software standby

One function of SYSCR is to enable or disable access to the on-chip RAM. The on-chip RAM is enabled or disabled by the RAME bit in SYSCR. For details about the other bits, see section 3.3, System Control Register (SYSCR).

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized at the rising edge of the input at the $\overline{\text{RES}}$ pin. It is not initialized in software standby mode.

Bit 0 RAME	Description
0	On-chip RAM is disabled
1	On-chip RAM is enabled (Initial value)

16.3 Operation

When the RAME bit is set to 1, the on-chip RAM is enabled. Accesses to the addresses shown in table 16.1 are directed to the on-chip RAM. In modes 1 to 5 (expanded modes), when the RAME bit is cleared to 0, the off-chip address space is accessed. In mode 6, 7 (single-chip mode), when the RAME bit is cleared to 0, the on-chip RAM is not accessed: read access always results in HFF data, and write access is ignored.

Since the on-chip RAM is connected to the CPU by an internal 16-bit data bus, it can be written and read by word access. It can also be written and read by byte access. Byte data is accessed in two states using the upper 8 bits of the data bus. Word data starting at an even address is accessed in two states using all 16 bits of the data bus.

Section 17 ROM

[H8/3062F-ZTAT R-Mask Version, On-Chip Masked ROM Models]

17.1 Overview

The H8/3062F-ZTAT R-mask version have 128 kbytes of on-chip flash memory. The H8/3062 (masked ROM version) has 128 kbytes of on-chip masked ROM, the H8/3061 (masked ROM version) has 96 kbytes, and the H8/3060 (masked ROM version) has 64 kbytes. The ROM is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, enabling rapid data transfer.

The on-chip ROM is enabled and disabled by setting the mode pins (MD₂ to MD₀) as shown in table 17.1.

The on-chip flash memory product (H8/3062F-ZTAT R-mask version) can be erased and programmed on-board, as well as with a special-purpose PROM programmer.

Table 17.1 Operating Modes and ROM

Mode	Mode Pins			On-Chip ROM
	MD ₂	MD ₁	MD ₀	
Mode 1 (expanded 1-Mbyte mode with on-chip ROM disabled)	0	0	1	Disabled (external address area)
Mode 2 (expanded 1-Mbyte mode with on-chip ROM disabled)	0	1	0	
Mode 3 (expanded 16-Mbyte mode with on-chip ROM disabled)	0	1	1	
Mode 4 (expanded 16-Mbyte mode with on-chip ROM disabled)	1	0	0	Enabled
Mode 5 (expanded 16-Mbyte mode with on-chip ROM enabled)	1	0	1	
Mode 6 (single-chip normal mode)	1	1	0	
Mode 7 (single-chip advanced mode)	1	1	1	

17.2 Overview of Flash Memory (H8/3062F-ZTAT R-Mask Version)

17.2.1 Features

The features of the flash memory in the H8/3062F-ZTAT R-mask version are summarized below.

- Four flash memory operating modes
 - Program mode
 - Erase mode
 - Program-verify mode
 - Erase-verify mode
- Programming/erase methods

The flash memory is programmed 32 bytes at a time. Erasing is performed in block units, with the blocks to be erased specified by setting the corresponding register bits. The flash memory is divided into three 32-kbyte blocks, one 28-kbyte block, and four 1-kbyte blocks.
- Programming/erase times

The flash memory programming time is 10 ms (typ) for simultaneous 32-byte programming, equivalent approximately to 300 μ s (typ) per byte, and the erase time is 100 ms (typ) per block.
- Reprogramming capability

The flash memory can be reprogrammed up to 100 times.
- On-board programming modes

There are two modes in which flash memory can be programmed/erased/verified on-board:

 - Boot mode
 - User program mode
- Automatic bit rate adjustment

For data transfer in boot mode, the chip's bit rate can be automatically adjusted to match the transfer bit rate of the host (9600 or 4800 bps).
- Protect modes

There are three protect modes—hardware, software, and error—which allow protected status to be designated for flash memory program/erase/verify operations.
- Flash memory emulation in RAM

Flash memory programming can be emulated in real time by overlapping a part of RAM onto flash memory.
- PROM mode

Flash memory can be programmed/erased in PROM mode, using a PROM programmer, as well as in on-board programming mode.

17.2.2 Block Diagram

Figure 17.1 shows a block diagram of the flash memory.

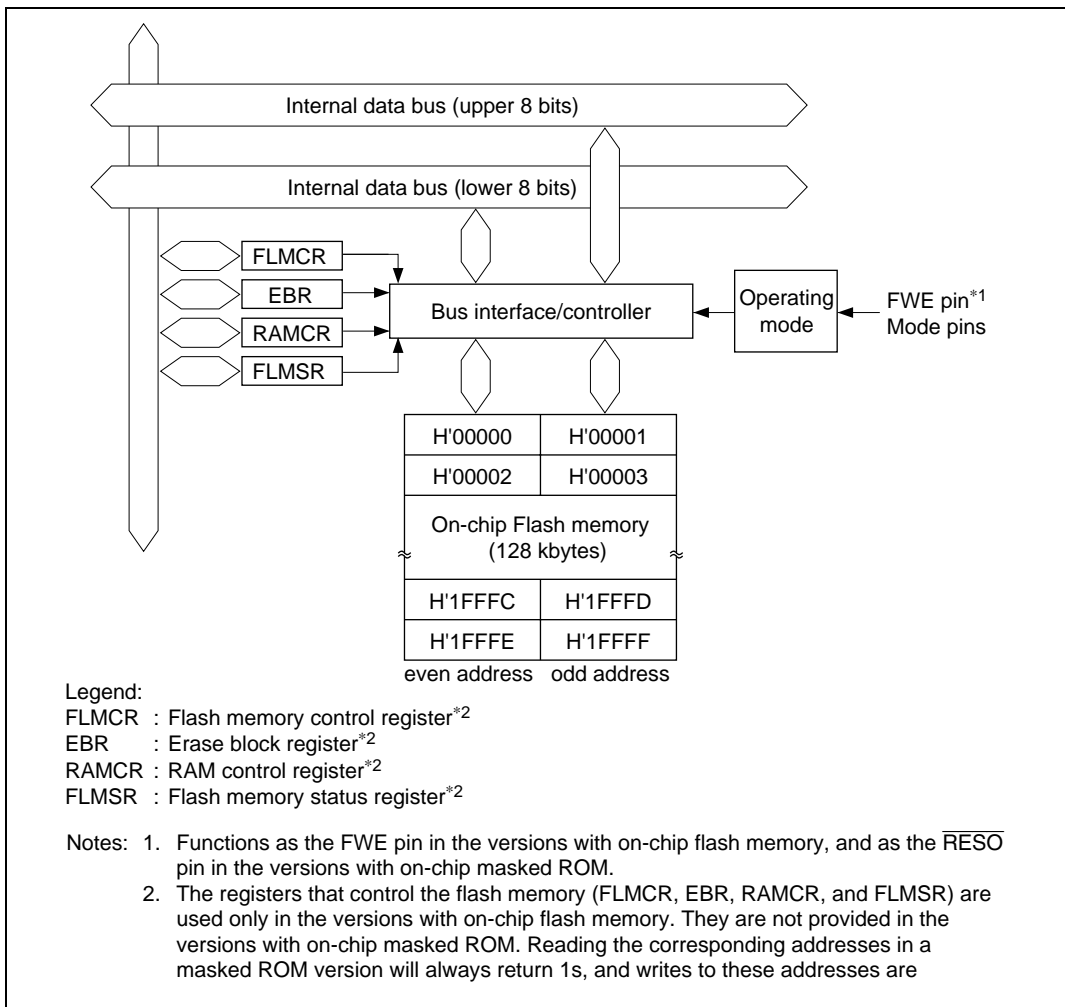

Figure 17.1 Block Diagram of Flash Memory

17.2.3 Pin Configuration

The flash memory is controlled by means of the pins shown in table 17.2.

Table 17.2 Flash Memory Pins

Pin Name	Abbreviation	I/O	Function
Reset	$\overline{\text{RES}}$	Input	Reset
Flash write enable	FWE*	Input	Flash program/erase protection by hardware
Mode 2	MD ₂	Input	Sets operating mode of H8/3062F-ZTAT R-mask version
Mode 1	MD ₁	Input	Sets operating mode of H8/3062F-ZTAT R-mask version
Mode 0	MD ₀	Input	Sets operating mode of H8/3062F-ZTAT R-mask version
Transmit data	TxD ₁	Output	Serial transmit data output
Receive data	RxD ₁	Input	Serial receive data input

Notes: The transmit data pin and receive data pin are used in boot mode.

* In the versions with on-chip masked ROM, the FWE pin functions as the $\overline{\text{RES0}}$ pin.

17.2.4 Register Configuration

The registers used to control the on-chip flash memory when enabled are shown in table 17.3.

Table 17.3 Flash Memory Registers

Register Name	Abbreviation	R/W	Initial Value	Address* ¹
Flash memory control register	FLMCR	R/W	H'00* ²	H'EE030
Erase block register	EBR	R/W	H'00	H'EE032
RAM control register	RAMCR	R/W	H'F1	H'EE077
Flash memory status register	FLMSR	R	H'7F	H'EE07D

Notes: FLMCR, EBR, RAMCR, and FLMSR are 8-bit registers, and should be accessed by byte access. These registers are used only in the versions with on-chip flash memory. Reading the corresponding addresses in a version with on-chip masked ROM will always return 1s, and writes to these addresses are disabled.

1. Lower 20 bits of address in advanced mode
2. When a high level is input to the FWE pin, the initial value is H'80.

17.3 Flash Memory Register Descriptions

17.3.1 Flash Memory Control Register (FLMCR)

FLMCR is an 8-bit register used for flash memory operating mode control. Program-verify mode or erase-verify mode is entered by setting SWE to 1 when FWE = 1, then setting the corresponding bit. Program mode is entered by setting SWE to 1 when FWE = 1, then setting the PSU bit, and finally setting the P bit. Erase mode is entered by setting SWE to 1 when FWE = 1, then setting the ESU bit, and finally setting the E bit. FLMCR is initialized by a reset, and in hardware standby mode and software standby mode. Its initial value is H'80 when a high level is input to the FWE pin, and H'00 when a low level is input. In mode 6 the FWE pin must be fixed low, as flash memory on-board programming is not supported. Therefore, bits in this register cannot be set to 1 in mode 6. When on-chip flash memory is disabled, a read will return H'00, and writes are invalid. When setting bits 6 to 0 in this register to 1, each bit should be set individually.

Writes to bits ESU, PSU, EV, and PV in FLMCR are enabled only when FWE = 1 and SWE = 1; writes to the E bit only when FWE = 1, SWE = 1, and ESU = 1; and writes to the P bit only when FWE = 1, SWE = 1, and PSU = 1.

Bit		7	6	5	4	3	2	1	0
		FWE	SWE	ESU	PSU	EV	PV	E	P
Modes 1 to 4, and 6	Initial value	0	0	0	0	0	0	0	0
	Read/Write	R	R	R	R	R	R	R	R
Modes 5 and 7	Initial value	1/0	0	0	0	0	0	0	0
	Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Program mode
Selects program mode transition or clearing

Erase mode
Selects erase mode transition or clearing

Program-verify mode
Selects program-verify mode transition or clearing

Erase-verify mode
Selects erase-verify mode transition or clearing

Program setup
Prepares for a transition to program mode

Erase setup
Prepares for a transition to erase mode

Software write enable
Enables or disables programming/erasing

Flash write enable
Sets hardware protection against flash memory programming/erasing

Bit 7—Flash Write Enable (FWE): Sets hardware protection against flash memory programming/erasing. See section 17.9, Flash Memory Programming and Erasing Precautions, for more information on the use of this bit.

Bit 7

FWE Description

0	When a low level is input to the FWE pin (hardware-protected state)
1	When a high level is input to the FWE pin

Bit 6—Software Write Enable (SWE)^{*1 *2}: Enables or disables flash memory programming and erasing. This bit should be set before setting FLMCR bits 5 to 0 and EBR bits 7 to 0 (Do not set the ESU, PSU, EV, PV, E, or P bit at the same time).

Bit 6 SWE	Description	
0	Programming/erasing disabled	(Initial value)
1	Programming/erasing enabled [Setting condition] When FWE = 1	

Bit 5—Erase Setup (ESU)*1: Prepares for a transition to erase mode (Do not set the SWE, PSU, EV, PV, E, or P bit at the same time).

Bit 5 ESU	Description	
0	Erase setup cleared	(Initial value)
1	Erase setup [Setting condition] When FWE = 1 and SWE = 1	

Bit 4—Program Setup (PSU)*1: Prepares for a transition to program mode (Do not set the SWE, ESU, EV, PV, E, or P bit at the same time).

Bit 4 PSU	Description	
0	Program setup cleared	(Initial value)
1	Program setup [Setting condition] When FWE = 1 and SWE = 1	

Bit 3—Erase-Verify Mode (EV)*1: Selects erase-verify mode transition or clearing (Do not set the SWE, ESU, PSU, PV, E, or P bit at the same time).

Bit 3 EV	Description	
0	Erase-verify mode cleared	(Initial value)
1	Transition to erase-verify mode [Setting condition] When FWE = 1 and SWE = 1	

Bit 2—Program-Verify Mode (PV)^{*1}: Selects program-verify mode transition or clearing (Do not set the SWE, ESU, PSU, EV, E, or P bit at the same time).

Bit 2

PV	Description	
0	Program-verify mode cleared	(Initial value)
1	Transition to program-verify mode [Setting condition] When FWE = 1 and SWE = 1	

Bit 1—Erase Mode (E)^{*1 *3}: Selects erase mode transition or clearing (Do not set the SWE, ESU, PSU, EV, PV, or P bit at the same time).

Bit 1

E	Description	
0	Erase mode cleared	(Initial value)
1	Transition to erase mode [Setting condition] When FWE = 1, SWE = 1, and ESU = 1	

Bit 0—Program 1 (P)^{*1 *3}: Selects program mode transition or clearing (Do not set the SWE, ESU, PSU, EV, PV, or E bit at the same time).

Bit 0

P	Description	
0	Program mode cleared	(Initial value)
1	Transition to program mode [Setting condition] When FWE = 1, SWE = 1, and PSU = 1	

Notes: 1. Do not set multiple bits simultaneously.

Do not cut V_{CC} when a bit is set.

- The SWE bit must not be set or cleared at the same time as other bits (ESU, PSU, EV, PV, E, or P).
- P bit and E bit setting should be carried out in accordance with the program/erase algorithm shown in section 17.5, Flash Memory Programming/Erasing.
See section 17.9, Flash Memory Programming and Erasing Precautions, for more information on the use of these bits.

17.3.2 Erase Block Register (EBR)

EBR is an 8-bit register that designates the flash memory block for erasure. EBR is initialized to H'00 by a reset, in hardware standby mode or software standby mode, when a high level is not input to the FWE pin, or when the SWE bit in FLMCR is 0 when a high level is applied to the FWE pin. When a bit is set in EBR, the corresponding block can be erased. Other blocks are erase-protected. The blocks are erased block by block. Therefore, set only one bit in EBR; do not set bits in EBR to erase two or more blocks at the same time.

Each bit in EBR cannot be set until the SWE bit in FLMCR is set. The flash memory block configuration is shown in table 17.4. To erase all the blocks, erase each block sequentially.

The H8/3062F-ZTAT R-mask version does not support the on-board programming mode in mode 6, so bits in this register cannot be set to 1 in mode 6.

Bit		7	6	5	4	3	2	1	0
		EB7	EB6	EB5	EB4	EB3	EB2	EB1	EB0
Modes 1 to 4, and 6	Initial value	0	0	0	0	0	0	0	0
	Read/Write	R	R	R	R	R	R	R	R
Modes 5 and 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 7 to 0—Block 7 to Block 0 (EB7 to EB0): Setting one of these bits specifies the corresponding block (EB7 to EB0) for erasure.

Bits 7–0

EB7–EB0

Description

0	Corresponding block (EB7 to EB0) not selected	(Initial value)
1	Corresponding block (EB7 to EB0) selected	

Note: When not performing an erase, clear all EBR bits to 0.

Table 17.4 Flash Memory Erase Blocks

Block (Size)	Address
EB0 (1 kbyte)	H'000000–H'0003FF
EB1 (1 kbyte)	H'000400–H'0007FF
EB2 (1 kbyte)	H'000800–H'000BFF
EB3 (1 kbyte)	H'000C00–H'000FFF
EB4 (28 kbytes)	H'001000–H'007FFF
EB5 (32 kbytes)	H'008000–H'00FFFF
EB6 (32 kbytes)	H'010000–H'017FFF
EB7 (32 kbytes)	H'018000–H'01FFFF

17.3.3 RAM Control Register (RAMCR)

RAMCR selects the RAM area to be used when emulating real-time flash memory programming.

Bit		7	6	5	4	3	2	1	0
		—	—	—	—	RAMS	RAM2	RAM1	—
Modes 1 to 4	Initial value	1	1	1	1	0	0	0	1
	Read/Write	—	—	—	—	R	R	R	—
Modes 5 to 7	Initial value	1	1	1	1	0	0	0	1
	Read/Write	—	—	—	—	R/W*	R/W*	R/W*	—

Reserved bits
RAM select
Reserved bit

RAM2, RAM1
 Used together with bit 3 to select
 a flash memory area

RAM select
 Used together with bits 2 and 1 to select
 a flash memory area

Note: * Cannot be set to 1 in mode 6.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bit 3—RAM Select (RAMS): Used with bits 2 to 1 to reassign an area to RAM (see table 17.5). The initial setting for this bit is 0 in modes 5, 6, and 7 (internal flash memory enabled) and programming is enabled*. In modes other than 5 to 7, 0 is always read and writing is disabled. This bit is initialized by a reset and in hardware standby mode. It is not initialized in software standby mode.

When bit 3 is set, all flash-memory blocks are protected from programming and erasing.

Bits 2 and 1—RAM2 and RAM1: These bits are used with bit 3 to reassign an area to RAM (see table 17.5). The initial setting for this bit is 0 in modes 5, 6, and 7 (internal flash memory enabled) and programming is enabled*. In modes other than 5 to 7, 0 is always read and writing is disabled. These bits are initialized by a reset and in hardware standby mode. They are not initialized in software standby mode.

Bit 0—Reserved: This bit cannot be modified and is always read as 1.

Note: * Flash memory emulation by RAM is not supported for mode 6 (single chip normal mode), so programming is possible, but do not set 1.

When performing flash memory emulation by RAM, the RAME bit in SYSCR must be set to 1.

Table 17.5 RAM Area Setting

RAM Area	Bit 3	Bit 2	Bit 1	RAM Emulation Status
	RAMS	RAM2	RAM1	
H'FFF000–H'FFF3FF	0	0/1	0/1	No emulation
H'000000–H'0003FF	1	0	0	Mapping RAM
H'000400–H'0007FF	1	0	1	
H'000800–H'000BFF	1	1	0	
H'000C00–H'000FFF	1	1	1	

Figure 17.2 Example of ROM Area/RAM Area Overlap

17.3.4 Flash Memory Status Register (FLMSR)

FLMSR is used to detect flash memory errors.

Bit	7	6	5	4	3	2	1	0
	FLER	—	—	—	—	—	—	—
Initial value	0	1	1	1	1	1	1	1
Read/Write	R	—	—	—	—	—	—	—

Reserved bits

Flash memory error (FLER)

Status flag indicating detection of an error during flash memory programming or erasing

Bit 7—Flash Memory Error (FLER): Indicates that an error has occurred during flash memory programming or erasing. When FLER is set to 1, flash memory is placed in the error-protection state.

Bit 7

FLER	Description
0	Flash memory program/erase protection (error protection ^{*1}) is disabled (Initial value) [Clearing condition] WDT reset, reset by $\overline{\text{RES}}$ pin, or hardware standby mode
1	An error has occurred during flash memory programming/erasing, and error protection ^{*1} has been enabled [Setting conditions] <ol style="list-style-type: none"> 1. When flash memory is read^{*2} during programming/erasing (including a vector read or instruction fetch, but excluding a read in a RAM area overlapped onto flash memory space) 2. Immediately after the start of exception handling during programming/erasing (excluding reset, illegal instruction, trap instruction, and division-by-zero exception handling)^{*3} 3. When a SLEEP instruction (including software standby) is executed during programming/erasing 4. When the bus is released during programming/erasing

Notes: 1. For details of error protection, see section 17.6.3, Error Protection.
2. An undefined value will be read in this case.
3. Before a stack or vector read is performed in exception handling.

Bits 6 to 0—Reserved: Read-only bits, always read as 1.

17.4 On-Board Programming Mode

When pins are set to on-board programming mode and a reset-start is executed, the chip enters the on-board programming state in which on-chip flash memory programming, erasing, and verifying can be carried out. There are two operating modes in this mode—boot mode and user program mode—set by the mode pins (MD_2 – MD_0) and the FWE pin. The pin settings for entering each mode are shown in table 17.6. Boot mode and user program mode cannot be used in mode 6 (on-chip ROM enabled) in the H8/3062F-ZTAT R-mask version. For notes on FWE pin application and disconnection, see section 17.9, Flash Memory Programming and Erasing Precautions.

Table 17.6 On-Board Programming Mode Settings

Mode		FWE	MD_2	MD_1	MD_0	Notes
Boot mode	Mode 5	1* ¹	0* ²	0	1	0: V_{IL}
	Mode 7		0* ²	1	1	1: V_{IH}
User program mode	Mode 5		1	0	1	
	Mode 7		1	1	1	

Notes: 1. For the High level input timing, see items 6 and 7 of Notes on Using the Boot Mode.

2. In boot mode, the MD_2 setting should be the inverse of the input.

In boot mode in the H8/3062F-ZTAT R-mask version, the values in mode select bits 2 to 0 (MDS_2 to MDS_0) in the mode control register (MDCR) are the inverse of the levels at the mode pins (MD_2 to MD_0). Note that this specification differs from that for H8/300H Series microcomputer H8/3039F-ZTAT.

On-Board Programming Modes

• Boot mode

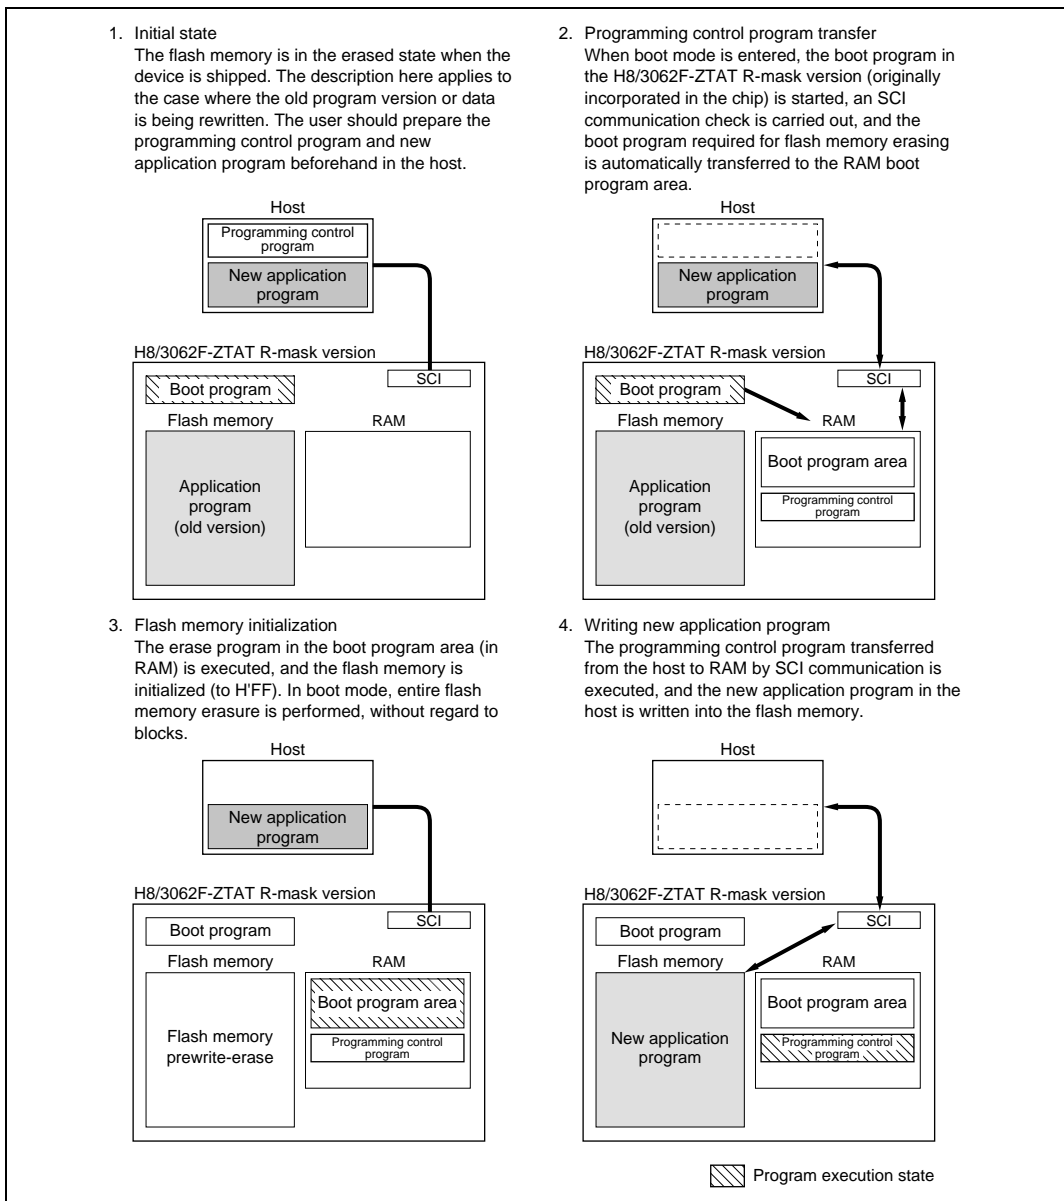

Figure 17.3 Boot Mode

- User program mode

1. Initial state

(1) The program that will transfer the programming/erase control program to on-chip RAM should be written into the flash memory by the user beforehand. (2) The programming/erase control program should be prepared in the host or in the flash memory.

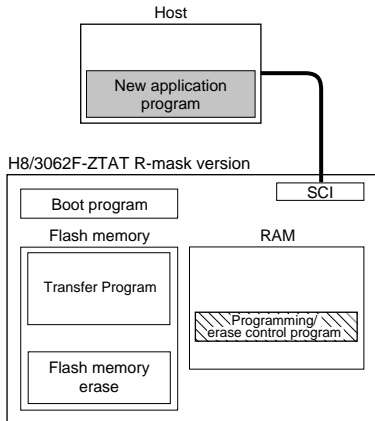

2. Programming/erase control program transfer

When the FWE pin is driven high, user software confirms this fact, executes the transfer program in the flash memory, and transfers the programming/erase control program to RAM.

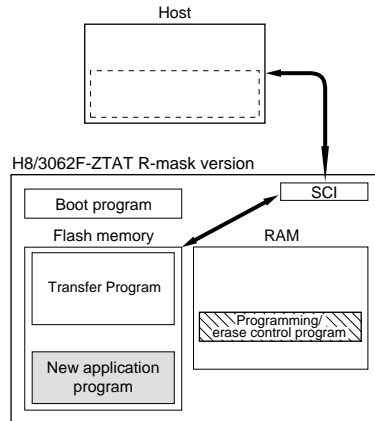

3. Flash memory initialization

The programming/erase program in RAM is executed, and the flash memory is initialized (to H'FF). Erasing can be performed in block units, but not in byte units.

4. Writing new application program

Next, the new application program in the host is written into the erased flash memory blocks. Do not write to unerased blocks.

 Program execution state

Figure 17.4 User Program Mode (Example)

17.4.1 Boot Mode

When boot mode is used, a flash memory programming control program must be prepared beforehand in the host, and SCI channel 1, which is to be used, must be set to asynchronous mode.

When a reset-start is executed after setting the pins of the H8/3062F-ZTAT R-mask version to boot mode, the boot program already incorporated in the MCU is activated, the low period of the data sent from the host is first measured, and the bit rate register (BRR) value determined. It is then possible to receive a user program from off-chip using the on-chip serial communication interface (SCI) in the H8/3062F-ZTAT R-mask version, and the received user program is written into the on-chip RAM.

Control then branches to the start address H'FFF400 of the on-chip RAM, the program written in RAM is executed, and flash memory programming/erasing can be carried out.

Figure 17.5 shows a system configuration diagram when using boot mode, and figure 17.6 shows the boot program mode execution procedure.

Figure 17.5 System Configuration When Using Boot Mode

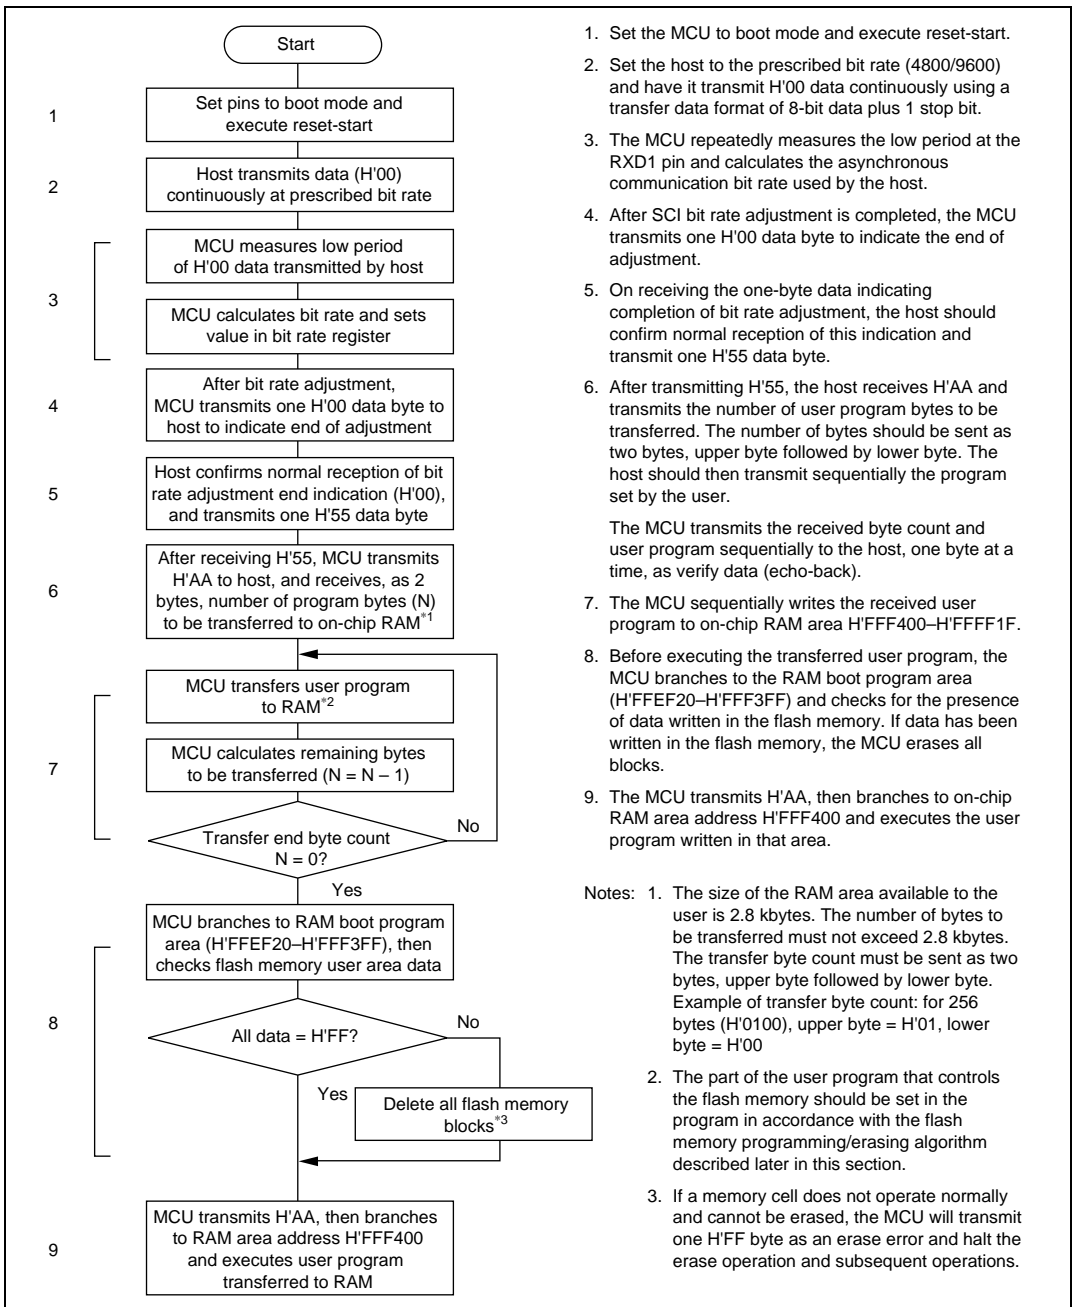

Figure 17.6 Boot Mode Execution Procedure

Automatic SCI Bit Rate Adjustment:**Figure 17.7 Measurement of Low Period of Host's Transmit Data**

When boot mode is initiated, the MCU measures the low period of the asynchronous SCI communication data (H'00) transmitted continuously from the host (figure 17.7). The SCI transmit/receive format should be set as 8-bit data, 1 stop bit, no parity. The MCU calculates the bit rate of the transmission from the host from the measured low period, and transmits one H'00 byte to the host to indicate the end of bit rate adjustment. The host should confirm that this adjustment end indication (H'00) has been received normally, and transmit one H'55 byte to the MCU. If reception cannot be performed normally, initiate boot mode again (reset), and repeat the above operations. Depending on the host's transmission bit rate and the MCU's system clock frequency, there will be a discrepancy between the bit rates of the host and the MCU. To ensure correct SCI operation, the host's transfer bit rate should be set to 4800 or 9600 bps^{*1}.

Table 17.7 shows typical host transfer bit rates and system clock frequencies for which automatic adjustment of the MCU bit rate is possible. The boot program should be executed within this system clock range^{*2}.

Table 17.7 System Clock Frequencies for which Automatic Adjustment of MCU Bit Rate is Possible

Host Bit Rate (bps)	System Clock Frequency for which Automatic Adjustment of MCU Bit Rate is Possible (MHz)
9600	8 to 20
4800	4 to 20

- Notes: 1. Use a host bit rate setting of 4800, or 9600 bps only. No other setting should be used.
 2. Although the MCU may also perform automatic bit rate adjustment with bit rate and system clock combinations other than those shown in table 17.7, a degree of error will arise between the bit rates of the host and the MCU, and subsequent transfer will not be performed normally. Therefore, only a combination of bit rate and system clock

frequency within one of the ranges shown in table 17.7 can be used for boot mode execution.

On-Chip RAM Area Divisions in Boot Mode: In boot mode, the RAM area is divided into an area used by the boot program and an area to which the user program is transferred via the SCI, as shown in figure 17.8. The boot program area becomes available when a transition is made to the execution state for the user program transferred to RAM.

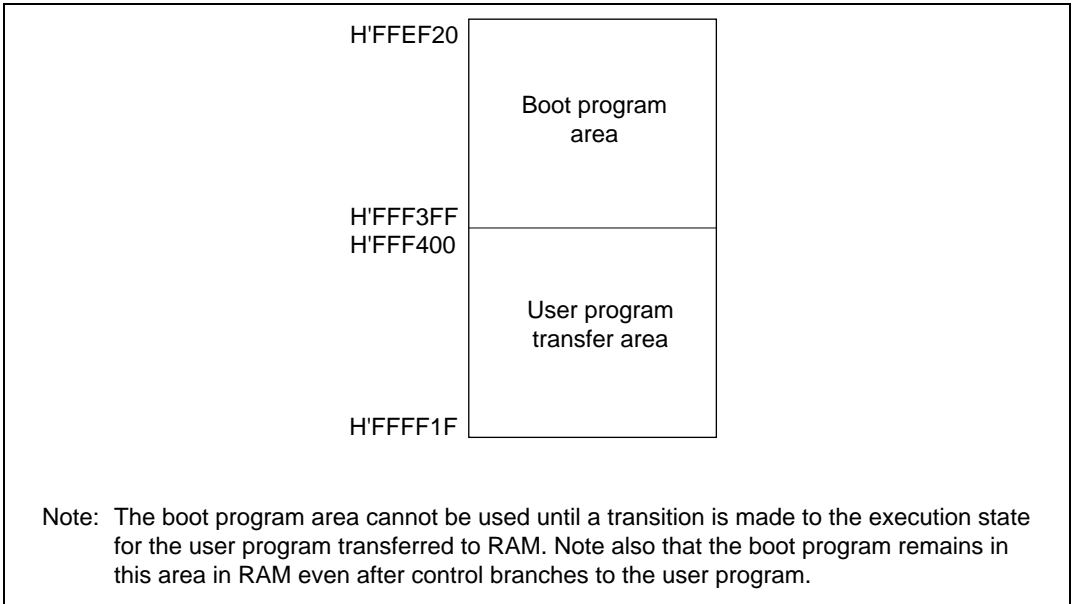

Figure 17.8 RAM Areas in Boot Mode

Notes on Use of Boot Mode:

1. When the H8/3062F-ZTAT R-mask version MCU comes out of reset in boot mode, it measures the low period of the input at the SCI's RXD₁ pin.
2. In boot mode, if any data has been programmed into the flash memory (if all data is not H'FF), all flash memory blocks are erased. Boot mode is for use when user program mode is unavailable, such as the first time on-board programming is performed, or if the program activated in user program mode is accidentally erased.
3. Interrupts cannot be used while the flash memory is being programmed or erased.
4. The RXD₁ and TXD₁ lines should be pulled up on the board.
5. Before branching to the user program the MCU terminates transmit and receive operations by the on-chip SCI (channel 1) (by clearing the RE and TE bits to 0 in the serial control register (SCR)), but the adjusted bit rate value remains set in the bit rate register (BRR). The transmit

data output pin, TXD₁, goes to the high-level output state (P9₁DDR = 1 in P9DDR, P9₁DR = 1 in P9DR).

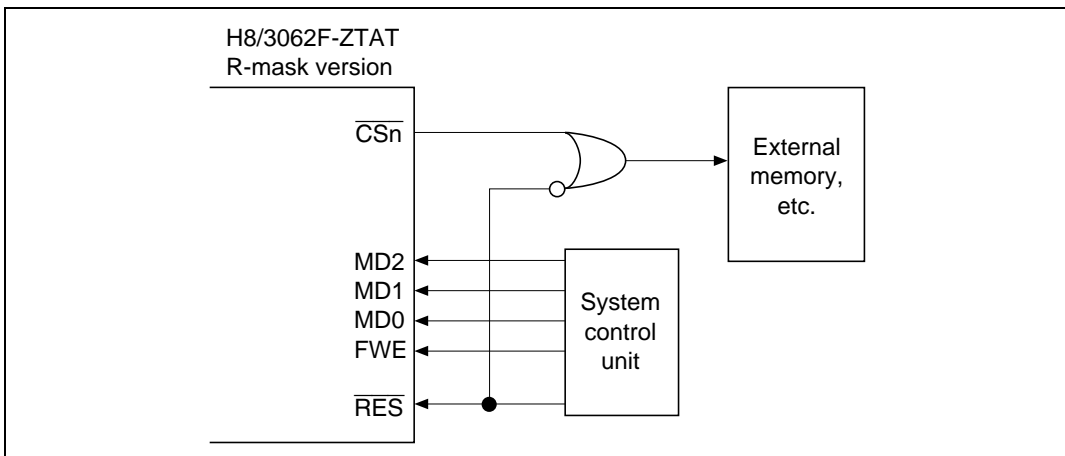

The contents of the CPU's internal general registers are undefined at this time, so these registers must be initialized immediately after branching to the user program. In particular, since the stack pointer (SP) is used implicitly in subroutine calls, etc., a stack area must be specified for use by the user program.

The initial values of other on-chip registers are not changed.

6. Boot mode can be entered by setting pins MD₀ to MD₂ and FWE in accordance with the mode setting conditions shown in table 17.6, and then executing a reset-start.

On reset release (a low-to-high transition)^{*1}, the MCU latches the current mode pin states internally and maintains the boot mode state. Boot mode can be cleared by driving the FWE pin low, then executing reset release^{*1}, but the following points must be noted.

- a. When switching from boot mode to normal mode, the boot mode state within the chip must first be cleared by reset input via the $\overline{\text{RES}}$ pin. The $\overline{\text{RES}}$ pin must be held low for at least 20 system clock cycles^{*3}.
 - b. Do not change the input levels at the mode pins (MD₂ to MD₀) or the FWE pin while in boot mode. When making a mode transition, first enter the reset state by inputting a low level to the $\overline{\text{RES}}$ pin. If a watchdog timer reset occurs in the boot mode state, the MCU's internal state will not be cleared, and the on-chip boot program will be restarted regardless of the mode pin settings.
 - c. The FWE pin must not be driven low while the boot program is running or flash memory is being programmed or erased^{*2}.
7. If the mode pin and FWE pin input levels are changed from 0 V to V_{CC} or from V_{CC} to 0 V during a reset (while a low level is being input to the $\overline{\text{RES}}$ pin), the microcomputer's operating mode will change. As a result, the state of ports with multiplexed address functions and bus control output pins ($\overline{\text{CSn}}$, $\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{HWR}}$, $\overline{\text{LWR}}$) will also change. Therefore, care must be taken to make pin settings to prevent these pins from being used directly as output signal pins during a reset, or to prevent collision with signals outside the MCU.

- Notes:
1. Mode pin and FWE pin input must satisfy the mode programming setup time (t_{MDS}) with respect to the reset release timing.
 2. For further information on FWE application and disconnection, see section 17.9, Flash Memory Programming and Erasing Precautions.
 3. See section 4.2.2, Reset Sequence, and section 17.9, Flash Memory Programming and Erasing Precautions. The reset period during operation is a minimum of 10 system clock cycles for the H8/3062, H8/3061, and H8/3060 (versions with on-chip masked ROM), but a minimum of 20 system clock cycles for the H8/3062F-ZTAT R-mask version.

17.4.2 User Program Mode

When the H8/3062F-ZTAT R-mask version is set to user program mode, its flash memory can be programmed and erased by executing a user program. Therefore, on-board reprogramming of the on-chip flash memory can be carried out by providing on-board means of FWE control and supply of programming data, and storing a program/erase control program in part of the program area as necessary.

To select user program mode, select a mode that enables the on-chip ROM (mode 5 or 7), and apply a high level to the FWE pin. In this mode, on-chip supporting modules other than flash memory operate as they normally would in modes 5 and 7.

Flash memory programming and erasing should not be carried out in mode 6. When mode 6 is set, the FWE pin must be driven low.

The flash memory itself cannot be read while being programmed or erased, so the control program that performs programming should be placed in external memory or transferred to RAM and executed there.

Figure 17.9 shows the execution procedure when user program mode is entered during program execution in RAM. It is also possible to start from user program mode in a reset-start.

Figure 17.9 User Program Mode Execution Procedure (Example)

- Notes:
1. Do not apply a constant high level to the FWE pin. To prevent inadvertent programming or erasing due to program runaway, etc., apply a high level to the FWE pin only when the flash memory is programmed or erased (including execution of flash memory emulation using RAM). Memory cells may not operate normally if overprogrammed or overerased due to program runaway, etc. Also, while a high level is applied to the FWE pin, the watchdog timer should be activated to prevent overprogramming or overerasing due to program runaway, etc.
 2. Flash memory rewriting should not be carried out in mode 6. When mode 6 is set, the FWE pin must be driven low.

17.5 Flash Memory Programming/Erasing

A software method, using the CPU, is employed to program and erase flash memory in the on-board programming modes. There are four flash memory operating modes: program mode, erase mode, program-verify mode, and erase-verify mode. Transitions to these modes are made by setting the PSU, ESU, P, E, PV, and EV bits in FLMCR.

The state transitions made by the various FLMCR bit settings are shown in figure 17.10. The flash memory cannot be read while being programmed or erased. Therefore, the program (user program) that controls flash memory programming/erasing should be located and executed in on-chip RAM or external memory.

See section 17.9, Flash Memory Programming and Erasing Precautions, for points to note concerning programming and erasing, and section 22.2.6, Flash Memory Characteristics, for the wait times after setting or clearing FLMCR bits.

- Notes:
1. Operation is not guaranteed if setting/clearing of the SWE, ESU, PSU, EV, PV, E, and P bits in FLMCR is executed by a program in flash memory.
 2. When programming or erasing, set the FWE pin input level to the high level, and set FWE to 1 (programming/erasing will not be executed if FWE = 0).

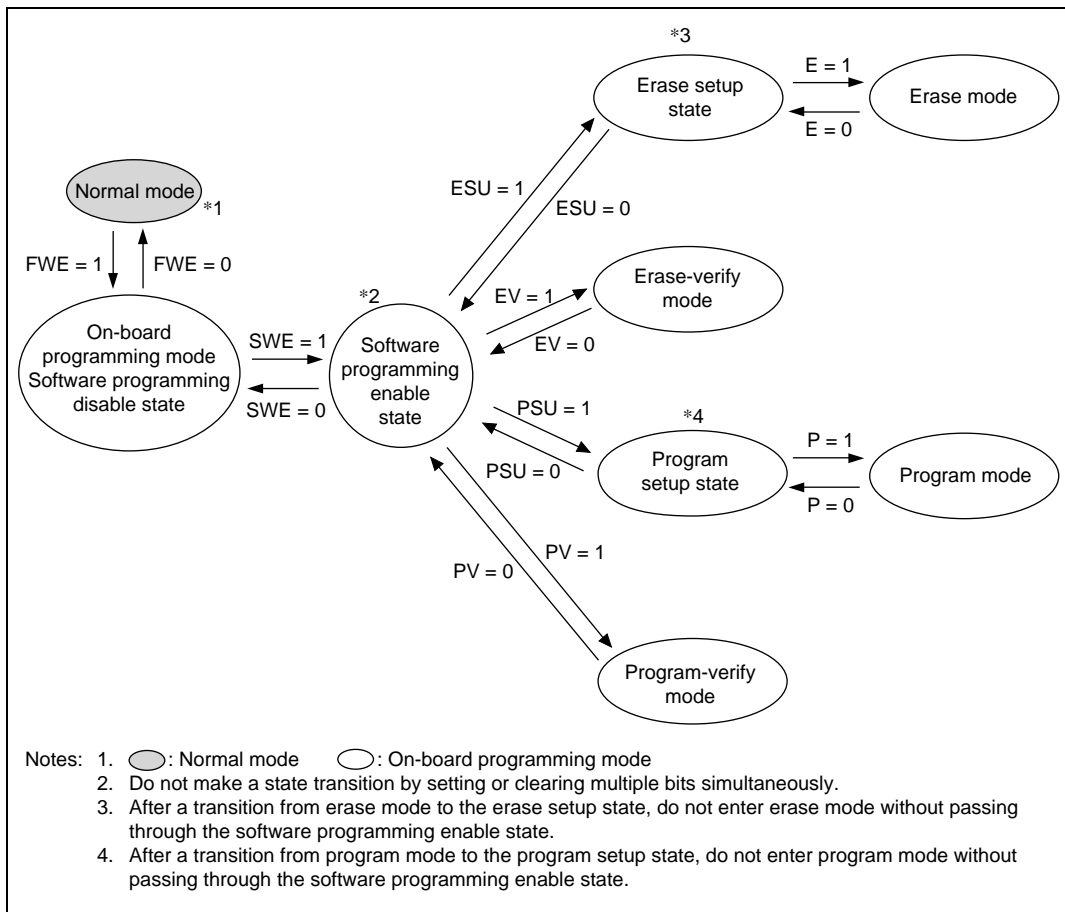

Figure 17.10 FLMCR Bit Settings and State Transitions

17.5.1 Program Mode

When writing data or programs to flash memory, the program/program-verify flowchart shown in figure 17.11 should be followed. Performing programming operations according to this flowchart will enable data or programs to be written to flash memory without subjecting the device to voltage stress or sacrificing program data reliability. Programming should be carried out 32 bytes at a time.

The wait times (x, y, z, α , β , γ , ϵ , η) after bits are set or cleared in the flash memory control register (FLMCR) and the maximum number of programming operations (N) are shown in table 22.20 in section 22.2.6, Flash Memory Characteristics.

Following the elapse of (x) μs or more after the SWE bit is set to 1 in FLMCR, 32-byte data is written consecutively to the write addresses. The lower 8 bits of the first address written to must be H'00, H'20, H'40, H'60, H'80, H'A0, H'C0, or H'E0. Thirty-two consecutive byte data transfers are performed. The program address and program data are latched in the flash memory. A 32-byte data transfer must be performed even if writing fewer than 32 bytes; in this case, H'FF data must be written to the extra addresses.

Next, the watchdog timer (WDT) is set to prevent overprogramming due to program runaway, etc. Set a value greater than ($y + z + \alpha + \beta$) μs as the WDT overflow period. Preparation for entering program mode (program setup) is performed next by setting the PSU bit in FLMCR. The operating mode is then switched to program mode by setting the P bit in FLMCR after the elapse of at least (y) μs . The time during which the P bit is set is the flash memory programming time. Make a program setting so that the time for one programming operation is within the range of (z) μs .

The wait time after P bit setting must be changed according to the number of reprogramming loops. For details, see section 22.2.6, Flash Memory Characteristics.

17.5.2 Program-Verify Mode

In program-verify mode, the data written in program mode is read to check whether it has been correctly written in the flash memory.

Clear the P bit in FLMCR, then wait for at least (α) μs before clearing the PSU bit to exit program mode. After exiting program mode, the watchdog timer setting is also cleared. The operating mode is then switched to program-verify mode by setting the PV bit in FLMCR. Before reading in program-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (γ) μs or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (ϵ) μs after the dummy write before performing this read operation. Next, the originally written data is compared with the verify data, and reprogram data is computed (see figure 17.11) and transferred to RAM. After verification of 32 bytes of data has been completed, exit program-verify mode, wait for at least (η) μs , then determine whether 32-byte programming has finished. If reprogramming is necessary, set program mode again, and repeat the program/program-verify sequence as before. The maximum number of repetitions of the program/program-verify sequence is indicated by the maximum number of programming operations (N).

Note: A 32-byte area to store program data and a 32-byte area to store reprogram data are required in RAM.

Figure 17.11 Program-Verify Flowchart (32-byte Programming)

17.5.3 Erase Mode

When erasing flash memory, the single-block erase flowchart shown in figure 17.12 should be followed.

The wait times (x , y , z , α , β , γ , ϵ , η) after bits are set or cleared in the flash memory control register (FLMCR) and the maximum number of erase operations (N) are shown in table 22.20 in section 22.2.6, Flash Memory Characteristics.

To erase flash memory contents, make a 1-bit setting for the flash memory area to be erased in erase block register (EBR) at least (x) μs after setting the SWE bit to 1 in FLMCR. Next, the watchdog timer (WDT) is set to prevent overerasing due to program runaway, etc. Set a value greater than (z) ms + ($y + \alpha + \beta$) μs as the WDT overflow period. Preparation for entering erase mode (erase setup) is performed next by setting the ESU bit in FLMCR. The operating mode is then switched to erase mode by setting the E bit in FLMCR after the elapse of at least (y) μs . The time during which the E bit is set is the flash memory erase time. Ensure that the erase time does not exceed (z) ms.

Note: With flash memory erasing, preprogramming (setting all memory data in the memory to be erased to all 0) is not necessary before starting the erase procedure.

17.5.4 Erase-Verify Mode

In erase-verify mode, data is read after memory has been erased to check whether it has been correctly erased.

After the elapse of the fixed erase time, clear the E bit in FLMCR, then wait for at least (α) μs before clearing the ESU bit to exit erase mode. After exiting erase mode, the watchdog timer setting is also cleared. The operating mode is then switched to erase-verify mode by setting the EV bit in FLMCR. Before reading in erase-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (y) μs or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (ϵ) μs after the dummy write before performing this read operation. If the read data has been erased (all 1), a dummy write is performed to the next address, and erase-verify is performed. If the read data is unerased, set erase mode again, and repeat the erase/erase-verify sequence as before. The maximum number of repetitions of the erase/erase-verify sequence is indicated by the maximum number of erase operations (N).

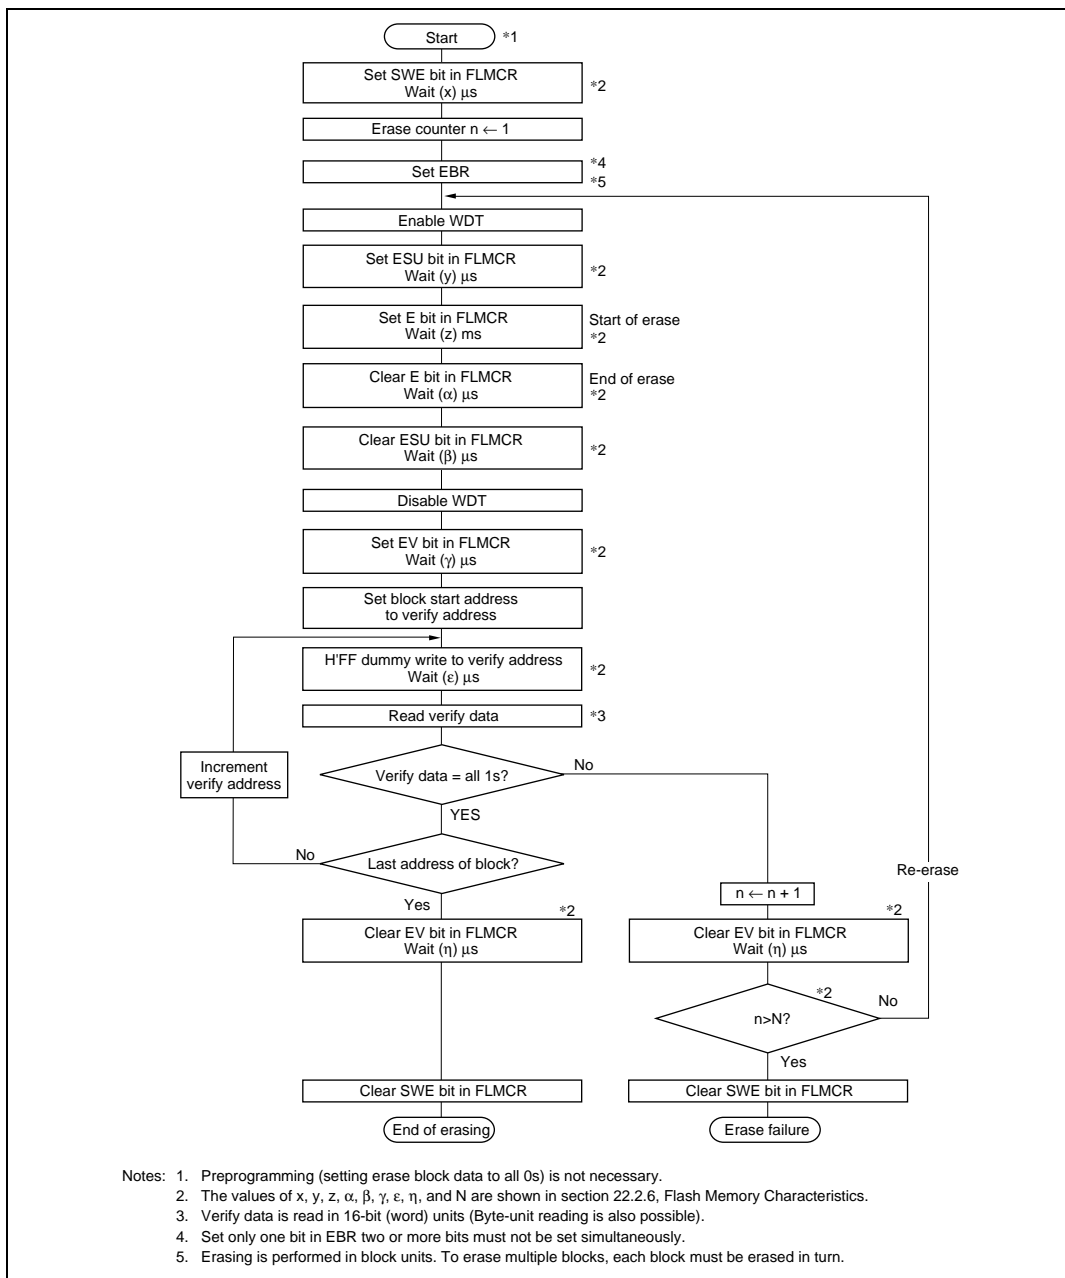

Figure 17.12 Erase/Erase-Verify Flowchart (Single-Block Erasing)

17.6 Flash Memory Protection

There are three kinds of flash memory program/erase protection: hardware, software, and error protection.

17.6.1 Hardware Protection

Hardware protection refers to a state in which programming/erasing of flash memory is forcibly disabled or aborted. Hardware protection is reset by settings in the flash memory control register (FLMCR) and the erase block register (EBR). In the case of error protection, the P bit and E bit can be set, but a transition is not made to program mode or erase mode (See table 17.8).

Table 17.8 Hardware Protection

Item	Description	Function		
		Program	Erase	Verify*1
FWE pin protection	<ul style="list-style-type: none"> When a low level is input to the FWE pin, FLMCR and EBR are initialized, and the program/erase-protected state is entered*4. 	Not possible*2	Not possible*3	Not possible
Reset/standby protection	<ul style="list-style-type: none"> In a reset (including a WDT overflow reset) and in standby mode, FLMCR and EBR are initialized, and the program/erase-protected state is entered. In a reset via the $\overline{\text{RES}}$ pin, the reset state is not entered unless the $\overline{\text{RES}}$ pin is held low until oscillation stabilizes after powering on (The minimum oscillation stabilization time is 20ms). In the case of a reset during operation, hold the $\overline{\text{RES}}$ pin low for at least 20 system clock cycles*5. 	Not possible	Not possible*3	Not possible

Item	Description	Function		
		Program	Erase	Verify ^{*1}
Error protection	<ul style="list-style-type: none"> When a microcomputer operation error (error generation (FLER=1)) was detected while flash memory was being programmed/erased, error protection is enabled. At this time, the FLMCR and EBR settings are held, but programming/erasing is aborted at the time the error was generated. Error protection is released only by a reset via the $\overline{\text{RES}}$ pin or a WDT reset, or in the hardware standby mode. 	Not possible	Not possible ^{*3}	Possible

- Notes:
- Two modes: program-verify and erase-verify
 - The RAM area that overlapped flash memory is deleted.
 - All blocks become unerasable and specification by block is impossible.
 - For more information, see section 17.9, Flash Memory Programming and Erasing Precautions.
 - See section 4.2.2, Reset Sequence and section 17.9, Flash Memory Programming and Erasing Precautions. The H8/3062F-ZTAT R-mask version require a minimum reset time during operation of 20 system clocks.

17.6.2 Software Protection

Software protection can be implemented by setting the RAMS bit in the RAM control register (RAMCR) and the erase block register (EBR). With software protection, setting the P or E bit in the flash memory control register (FLMCR) does not cause a transition to program mode or erase mode (See table 17.9).

Table 17.9 Software Protection

Item	Description	Functions		
		Program	Erase	Verify* ¹
Emulation protection* ²	<ul style="list-style-type: none"> Setting the RAMS bit 1 in RAMCR places all blocks in the program/erase-protected state. 	Not possible* ²	Not possible* ³	Possible
Block specification protection	<ul style="list-style-type: none"> Erase protection can be set for individual blocks by settings in EBR*⁴. However, protection against programming is disabled. Setting EBR to H'00 places all blocks in the erase-protected state. 	—	Not possible	Possible

Notes: 1. Two modes: program-verify and erase-verify
 2. A RAM area overlapping flash memory can be programmed.
 3. All blocks are unerasable and block-by-block specification is not possible.
 4. When not erasing, set EBR to H'00.

17.6.3 Error Protection

In error protection, an error is detected when MCU runaway occurs during flash memory programming/erasing*¹, or operation is not performed in accordance with the program/erase algorithm, and the program/erase operation is aborted. Aborting the program/erase operation prevents damage to the flash memory due to overprogramming or overerasing.

If the MCU malfunctions during flash memory programming/erasing, the FLER bit is set to 1 in the flash memory status register (FLMSR)*² and the error protection state is entered. FLMCR and EBR settings*³ are retained, but program mode or erase mode is aborted at the point at which the error occurred. Program mode or erase mode cannot be re-entered by re-setting the P or E bit in FLMCR. However, PV and EV bit setting is enabled, and a transition can be made to verify mode.

Error protection is released only by a $\overline{\text{RES}}$ pin reset, and a WDT reset, or in hardware standby mode.

Figure 17.13 shows the flash memory state transition diagram.

- Notes:
1. This is the state in which the P bit or E bit is set to 1 in FLMCR. Note that NMI input is disabled in this state. For details see section 17.6.4, NMI Input Disabling Conditions.
 2. For details of FLER bit setting conditions, see section 17.3.4, Flash Memory Status Register (FLMSR).
 3. FLMCR and EBR can be written to. However, registers will be initialized if a transition is made to software standby mode in the error protection state.

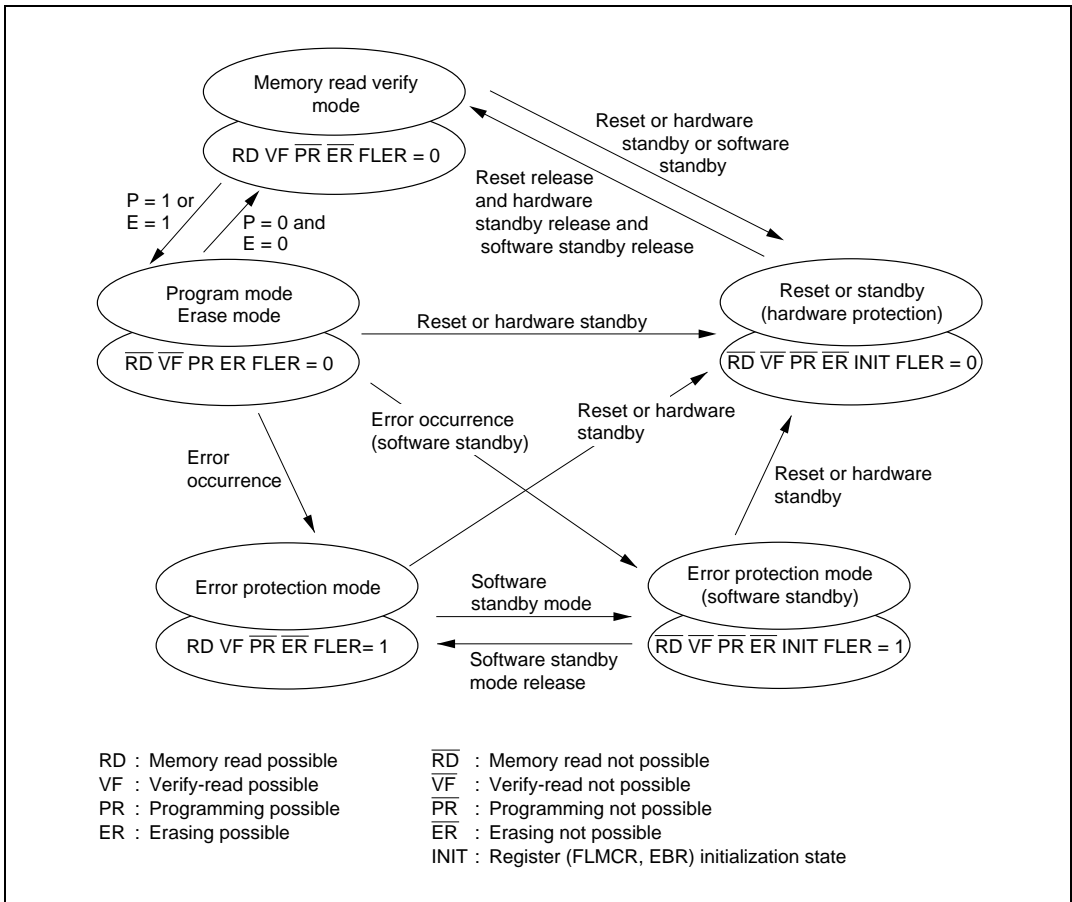

Figure 17.13 Flash Memory State Transitions (Modes 5 and 7 (On-Chip ROM Enabled), High Level Applied to FWE Pin)

The error protection function is invalid for abnormal operations other than the FLER bit setting conditions. Also, if a certain time has elapsed before this protection state is entered, damage may already have been caused to the flash memory. Consequently, this function cannot provide complete protection against damage to flash memory.

To prevent such abnormal operations, therefore, it is necessary to ensure correct operation in accordance with the program/erase algorithm, with the flash write enable (FWE) voltage applied, and to conduct constant monitoring for MCU errors, internally and externally, using the watchdog timer or other means. There may also be cases where the flash memory is in an erroneous programming or erroneous erasing state at the point of transition to this protection mode, or where programming or erasing is not properly carried out because of an abort. In cases such as these, a

forced recovery (program rewrite) must be executed using boot mode. However, it may also happen that boot mode cannot be normally initiated because of overprogramming or overerasing.

17.6.4 NMI Input Disabling Conditions

NMI input is disabled when flash memory is being programmed or erased and while the boot program is executing in boot mode (until a branch is made to the on-chip RAM area)^{*1}, to give priority to the program or erase operation. There are three reasons for this:

1. NMI input during programming or erasing might cause a violation of the programming or erasing algorithm, with the result that normal operation could not be assured.
2. In the NMI exception handling sequence during programming or erasing, the vector would not be read correctly^{*2}, possibly resulting in MCU runaway.
3. If NMI input occurred during boot program execution, it would not be possible to execute the normal boot mode sequence.

For these reasons, in on-board programming mode alone there are conditions for disabling NMI input, as an exception to the general rule. However, this provision does not guarantee normal erasing and programming or MCU operation. All requests (exception handling and bus release), including NMI, must therefore be restricted inside and outside the MCU during FWE application. NMI input is also disabled in the error protection state and while the P or E bit remains set in FLMCR during flash memory emulation in RAM.

- Notes:
1. This is the interval until a branch is made to the boot program area in the on-chip RAM H'FFEF20 to H'FFF3FF (This branch takes place immediately after transfer of the user program is completed). Consequently, after the branch to the RAM area, NMI input is enabled except during programming and erasing. Interrupt requests must therefore be disabled inside and outside the MCU until the user program has completed initial programming (including the vector table and the NMI interrupt handling routine).
 2. The vector may not be read correctly in this case for the following two reasons:
 - If flash memory is read while being programmed or erased, correct read data will not be obtained (undetermined values will be returned).
 - If the NMI entry in the vector table has not been programmed yet, NMI exception handling will not be executed correctly.

17.7 Flash Memory Emulation in RAM

As flash memory programming and erasing takes time, it may be difficult to carry out tuning by writing parameters and other data in real time. In this case, real-time programming of flash memory can be emulated by overlapping part of RAM (H'FFF000 to H'FFF3FF) onto a small block area in flash memory. This RAM area change is executed by means of bits 3 to 1 in the RAM control register (RAMCR). After the RAM area change, access is possible both from the area overlapped onto flash memory and from the original area (H'FFF000 to H'FFF3FF). For details of RAMCR and the RAM area setting method, see section 17.3.3, RAM Control Register (RAMCR).

Example of Emulation of Real-Time Flash Memory Programming: In the following example, RAM area H'FFF000 to H'FFF3FF is overlapped onto flash memory area EB2 (H'000800 to H'000BFF).

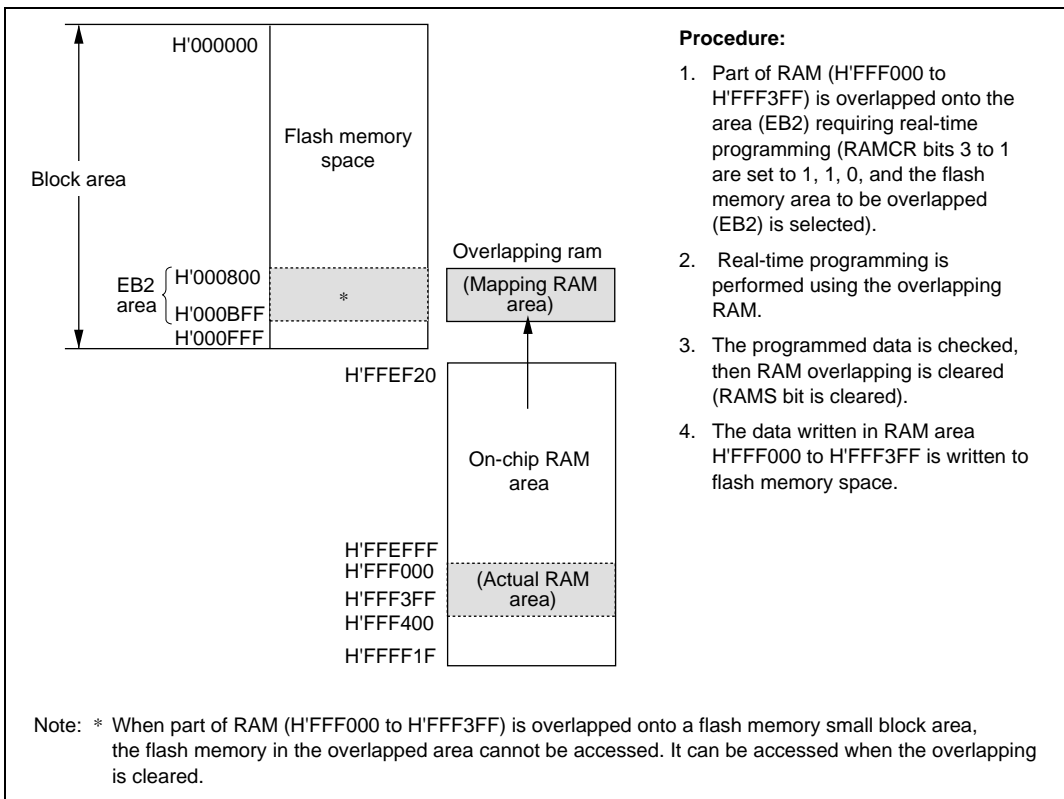

Figure 17.14 Example of RAM Overlap Operation

Notes on Use of Emulation in RAM:

1. Flash write enable (FWE) application and releasing

As in on-board program mode, care is required when applying and releasing FWE to prevent erroneous programming or erasing. To prevent erroneous programming and erasing due to program runaway during FWE application, in particular, the watchdog timer should be set when the PSU, P, ESU, or E bit is set to 1 in FLMCR1, even while the emulation function is being used. For details, see section 17.9, Flash Memory Programming and Erasing Precautions.

2. NMI input disabling conditions

When the emulation function is used, NMI input is disabled when the P bit or E bit is set to 1 in FLMCR, in the same way as with normal programming and erasing.

The P and E bits are cleared by a reset (including a watchdog timer reset), in standby mode, when a high level is not being input to the FWE pin, or when the SWE bit in FLMCR is 0 while a high level is being input to the FWE pin.

17.8 Flash Memory PROM Mode

The H8/3062F-ZTAT R-mask version have a PROM mode as well as the on-board programming modes for programming and erasing flash memory. In PROM mode, the on-chip ROM can be freely programmed using a general-purpose PROM writer that supports the Renesas microcomputer device type with 128-kbyte on-chip flash memory.

17.8.1 Socket Adapters and Memory Map

In PROM mode using a PROM writer, memory reading (verification) and writing and flash memory initialization (total erasure) can be performed. For these operations, a special socket adapter is mounted in the PROM writer. The socket adapter product codes are given in table 17.10. In the H8/3062F-ZTAT R-mask version PROM mode, only the socket adapters shown in this table should be used.

Table 17.10 H8/3062F-ZTAT R-Mask Version Socket Adapter Product Codes

Product Code	Package	Socket Adapter Product Code	Manufacturer
HD64F3062RF	100-pin QFP (FP-100B)	ME3067ESHF1H	MINATO ELECTRONICS INC.
HD64F3062RTE	100-pin TQFP (TFP-100B)	ME3067ESNF1H	
HD64F3062RFP	100-pin QFP (FP-100A)	ME3067ESFF1H	DATA I/O JAPAN CO.
HD64F3062RF	100-pin QFP (FP-100B)	HF306BQ100D3201	
HD64F3062RTE	100-pin TQFP (TFP-100B)	HF306XT100D3201	
HD64F3062RFP	100-pin QFP (FP-100A)	HF306AQ100D3201	

Figure 17.15 shows the memory map in PROM mode.

Figure 17.15 Memory Map in PROM Mode

17.8.2 Notes on Use of PROM Mode

1. A write to a 128-byte programming unit in PROM mode should be performed once only. Erasing must be carried out before reprogramming an address that has already been programmed.
2. When using a PROM writer to reprogram a device on which on-board programming/erasing has been performed, it is recommended that erasing be carried out before executing programming.
3. The memory is initially in the erased state when the device is shipped by Renesas. For samples for which the erasure history is unknown, it is recommended that erasing be executed to check and correct the initialization (erase) level.
4. The H8/3062F-ZTAT R-mask version do not support a product identification mode as used with general-purpose EPROMs, and therefore the device name cannot be set automatically in the PROM writer.
5. Refer to the instruction manual provided with the socket adapter, or other relevant documentation, for information on PROM writers and associated program versions that are compatible with the PROM mode of the H8/3062F-ZTAT R-mask version.

17.9 Flash Memory Programming and Erasing Precautions

Precautions concerning the use of on-board programming mode, the RAM emulation function, and PROM mode are summarized below.

1. Use the specified voltages and timing for programming and erasing.

Applied voltages in excess of the rating can permanently damage the device. Use a PROM programmer that supports the Renesas microcomputer device type with 128-kbyte on-chip flash memory.

Do not select the HN28F101 setting for the PROM programmer. An incorrect setting will result in application of a high level to the FWE pin, damaging the device.

2. Powering on and off (see figures 17.16 to 17.18)

Do not apply a high level to the FWE pin until V_{CC} has stabilized. Also, drive the FWE pin low before turning off V_{CC} .

When applying or disconnecting V_{CC} power, fix the FWE pin low and place the flash memory in the hardware protection state.

The power-on and power-off timing requirements should also be satisfied in the event of a power failure and subsequent recovery. Failure to do so may result in overprogramming or overerasing due to MCU runaway, and loss of normal memory cell operation.

3. FWE application/disconnection (see figures 17.16 to 17.18)

FWE application should be carried out when MCU operation is in a stable condition. If MCU operation is not stable, fix the FWE pin low and set the protection state.

The following points must be observed concerning FWE application and disconnection to prevent unintentional programming or erasing of flash memory:

- Apply FWE when the V_{CC} voltage has stabilized within its rated voltage range.
If FWE is applied when the MCU's V_{CC} power supply is not within its rated voltage range, MCU operation will be unstable and flash memory may be erroneously programmed or erased.
- Apply FWE when oscillation has stabilized (after the elapse of the oscillation settling time).
When V_{CC} power is turned on, hold the \overline{RES} pin low for the duration of the oscillation settling time ($t_{OSC1} = 20$ ms) before applying FWE. Do not apply FWE when oscillation has stopped or is unstable.

- In boot mode, apply and disconnect FWE during a reset.
In a transition to boot mode, FWE = 1 input and MD₂ to MD₀ setting should be performed while the $\overline{\text{RES}}$ input is low. FWE and MD₂ to MD₀ pin input must satisfy the mode programming setup time (t_{MDS}) with respect to the reset release timing. When making a transition from boot mode to another mode, also, a mode programming setup time is necessary with respect to the reset release timing.
In a reset during operation, the $\overline{\text{RES}}$ pin must be held low for a minimum of 20 system clock cycles.
- In user program mode, FWE can be switched between high and low level regardless of $\overline{\text{RES}}$ input.
FWE input can also be switched during execution of a program in flash memory.
- Do not apply FWE if program runaway has occurred.
During FWE application, the program execution state must be monitored using the watchdog timer or some other means.
- Disconnect FWE only when the SWE, ESU, PSU, EV, PV, E, and P bits in FLMCR are cleared.
Make sure that the SWE, ESU, PSU, EV, PV, E, and P bits are not set by mistake when applying or disconnecting FWE.

4. Do not apply a constant high level to the FWE pin

To prevent erroneous programming or erasing due to program runaway, etc., apply a high level to the FWE pin only when programming or erasing flash memory (including execution of flash memory emulation using RAM). A system configuration in which a high level is constantly applied to the FWE pin should be avoided. Also, while a high level is applied to the FWE pin, the watchdog timer should be activated to prevent overprogramming or overerasing due to program runaway, etc.

5. Use the recommended algorithm when programming and erasing flash memory.

The recommended algorithm enables programming and erasing to be carried out without subjecting the device to voltage stress or sacrificing program data reliability. When setting the PSU or ESU bit in FLMCR, the watchdog timer should be set beforehand as a precaution against program runaway, etc.

6. Do not set or clear the SWE bit during execution of a program in flash memory.

Clear the SWE bit before executing a program or reading data in flash memory. When the SWE bit is set, data in flash memory can be rewritten, but flash memory should only be accessed for verify operations (verification during programming/erasing).

Similarly, when using the RAM emulation function while a high level is being input to the FWE pin, the SWE bit must be cleared before executing a program or reading data in flash memory. However, the RAM area overlapping flash memory space can be read and written to regardless of whether the SWE bit is set or cleared.

7. Do not use interrupts while flash memory is being programmed or erased.

All interrupt requests, including NMI, should be disabled during FWE application to give priority to program/erase operations (including emulation in RAM).

Bus release must also be disabled.

8. Do not perform additional programming. Erase the memory before reprogramming.

In on-board programming, perform only one programming operation on a 32-byte programming unit block. In PROM mode, too, perform only one programming operation on a 128-byte programming unit block. Programming should be carried out with the entire programming unit block erased.

- Use byte access on the registers that control the flash memory (FLMCR, EBR, FLMSR, and RAMCR).

17.10 Masked ROM (H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, H8/3060 Masked ROM Version) Overview

17.10.1 Block Diagram

Figure 17.19 shows a block diagram of the ROM.

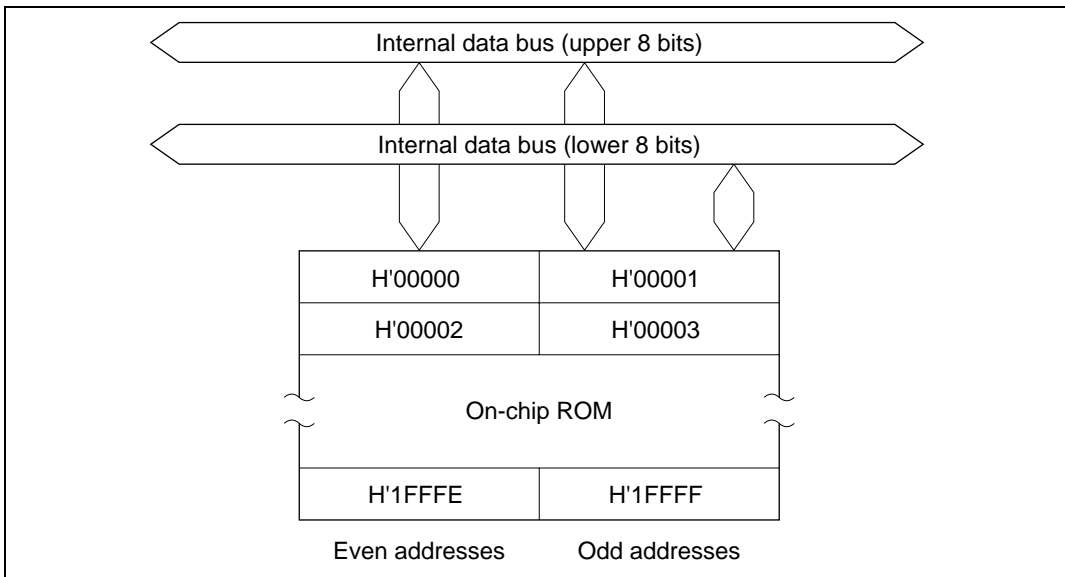

Figure 17.19 ROM Block Diagram (H8/3062 Masked ROM Version)

17.11 Notes on Ordering Masked ROM Version Chips

When ordering H8/3062, H8/3061, and H8/3060 with masked ROM, note the following.

1. When ordering by means of an EPROM, use a 128-kbyte one.
2. Fill all unused addresses with H'FF as shown in figure 17.20 to make the ROM data size 128-kbytes for the H8/3062, H8/3061, and H8/3060 masked ROM versions, which incorporate different sizes of ROM. This applies to ordering by means of an EPROM and by means of data transmission.

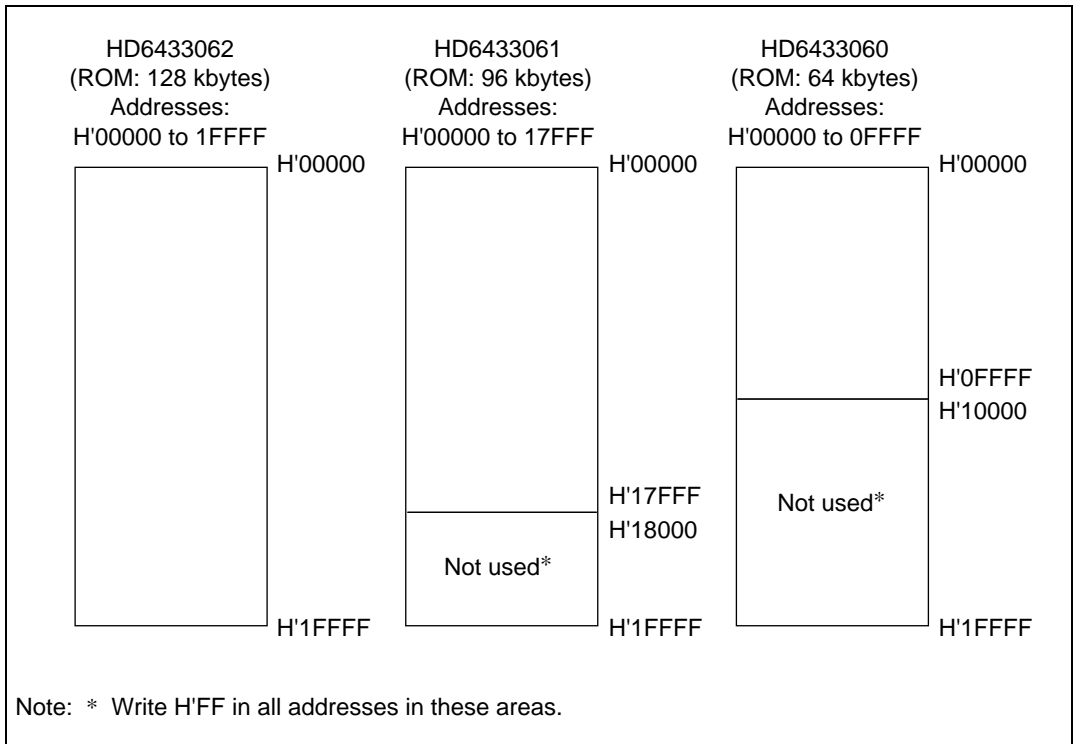

Figure 17.20 Masked ROM Addresses and Data

3. The flash memory control registers (FLMCR, EBR, RAMCR, FLMSR, FLMCR1, FLMCR2, EBR1, and EBR2) used by the versions with on-chip flash memory are not provided in the masked ROM versions. Reading the corresponding addresses in a masked ROM version will always return 1s, and writes to these addresses are disabled. This must be borne in mind when switching from a flash memory version to a masked ROM version.

4. 5 V operation models of the H8/3064F-ZTAT B-mask version and H8/3062F-ZTAT B-mask version with on-chip flash memory have a V_{CL} pin that requires the connection of an external capacitor. Care is therefore necessary regarding board design when switching to a masked ROM version.

17.12 Notes when Converting the F-ZTAT Application Software to the Masked ROM Versions

Please note the following when converting the F-ZTAT application software to the masked ROM versions.

The values read from the internal registers for the flash ROM in the masked ROM version and F-ZTAT version differ as follows.

Register	Bit	Value	Status	
			F-ZTAT Version	Masked ROM Version
FLMCR1	FWE	0	Application software running	— (Is not read out)
		1	Programming	Application software running (This bit is always read as 1)

Note: This difference applies to all the F-ZTAT versions and all the masked ROM versions that have different ROM size.

Section 18 H8/3064 Internal Voltage Step-Down Version ROM

[H8/3064F-ZTAT B-Mask Version, H8/3064 Masked ROM B-Mask Version]

18.1 Overview

The H8/3064F-ZTAT B-mask version has 256 kbytes of on-chip flash memory. The H8/3064 masked ROM B-mask version has 256 kbytes of on-chip masked ROM. The flash memory is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, enabling rapid data transfer.

The on-chip ROM is enabled and disabled by setting the mode pins (MD₂ to MD₀) as shown in table 18.1.

The on-chip flash memory product (H8/3064F-ZTAT B-mask version) can be erased and programmed on-board, as well as with a special-purpose PROM programmer.

Table 18.1 Operating Modes and ROM

Mode	Mode Pins			On-Chip ROM
	MD2	MD1	MD0	
Mode 1 (expanded 1-Mbyte mode with on-chip ROM disabled)	0	0	1	Disabled (external address area)
Mode 2 (expanded 1-Mbyte mode with on-chip ROM disabled)	0	1	0	
Mode 3 (expanded 16-Mbyte mode with on-chip ROM disabled)	0	1	1	
Mode 4 (expanded 16-Mbyte mode with on-chip ROM disabled)	1	0	0	
Mode 5 (expanded 16-Mbyte mode with on-chip ROM enabled)	1	0	1	Enabled
Mode 6 (single-chip normal mode)	1	1	0	
Mode 7 (single-chip advanced mode)	1	1	1

- Notes: 1. See section 18.6, Flash Memory Programming/Erasing, for details of the H8/3064F-ZTAT B-mask version program/erase algorithms.
 2. See section 22.3.6, Flash Memory Characteristics, for details of the H8/3064F-ZTAT B-mask version flash memory characteristics.

18.2 Features

The H8/3064F-ZTAT B-mask version has 256 kbytes of on-chip flash memory.

The features of the flash memory are summarized below.

- Four flash memory operating modes
 - Program mode
 - Erase mode
 - Program-verify mode
 - Erase-verify mode
- Programming/erase methods

The flash memory is programmed 128 bytes at a time. Erasing is performed in block units. To erase the entire flash memory, each block must be erased in turn. In block erasing, 4-kbyte, 32-kbyte, and 64-kbyte blocks can be set arbitrarily.
- Programming/erase times

The flash memory programming time is 10 ms (typ) for simultaneous 128-byte programming, equivalent approximately to 80 μ s (typ) per byte, and the erase time is 100 ms (typ) per block.
- Reprogramming capability

The flash memory can be reprogrammed up to 100 times.
- On-board programming modes

There are two modes in which flash memory can be programmed/erased/verified on-board:

 - Boot mode
 - User program mode
- Automatic bit rate adjustment

For data transfer in boot mode, the H8/3064F-ZTAT B-mask version chip's bit rate can be automatically adjusted to match the transfer bit rate of the host.
- Flash memory emulation in RAM

Flash memory programming can be emulated in real time by overlapping a part of RAM onto flash memory.
- Protect modes

There are three protect modes—hardware, software, and error—which allow protected status to be designated for flash memory program/erase/verify operations.
- PROM mode

Flash memory can be programmed/erased in PROM mode, using a PROM programmer, as well as in on-board programming mode.

18.2.1 Block Diagram

Figure 18.1 Block Diagram of Flash Memory

18.2.2 Pin Configuration

The flash memory is controlled by means of the pins shown in table 18.3.

Table 18.3 Flash Memory Pins

Pin Name	Abbreviation	I/O	Function
Reset	$\overline{\text{RES}}$	Input	Reset
Flash write enable	FWE	Input	Flash program/erase protection by hardware
Mode 2	MD ₂	Input	Sets H8/3064F-ZTAT B-mask version operating mode
Mode 1	MD ₁	Input	Sets H8/3064F-ZTAT B-mask version operating mode
Mode 0	MD ₀	Input	Sets H8/3064F-ZTAT B-mask version operating mode
Transmit data	TxD ₁	Output	Serial transmit data output
Receive data	RxD ₁	Input	Serial receive data input

18.2.3 Register Configuration

The registers used to control the on-chip flash memory when enabled are shown in table 18.4.

Table 18.4 Flash Memory Registers

Register Name	Abbreviation	R/W	Initial Value	Address* ¹
Flash memory control register 1	FLMCR1	R/W	H'00* ²	H'EE030
Flash memory control register 2	FLMCR2	R	H'00	H'EE031
Erase block register 1	EBR1	R/W	H'00	H'EE032
Erase block register 2	EBR2	R/W	H'00	H'EE033
RAM control register	RAMCR	R/W	H'F0	H'EE077

Notes: FLMCR1, FLMCR2, EBR1, EBR2, and RAMCR are 8-bit registers, and should be accessed by byte access. These registers are used only in the versions with on-chip flash memory, and are not provided in the versions with on-chip masked ROM. Reading the corresponding addresses in a masked ROM version will always return 1s, and writes to these addresses are invalid.

1. Lower 20 bits of address in advanced mode
2. When a high level is input to the FWE pin, the initial value is H'80.

18.3 Register Descriptions

18.3.1 Flash Memory Control Register 1 (FLMCR1)

Bit	7	6	5	4	3	2	1	0
	FWE	SWE	ESU	PSU	EV	PV	E	P
Initial value	—*	0	0	0	0	0	0	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: * Determined by the state of the FWE pin.

FLMCR1 is an 8-bit register used for flash memory operating mode control.

Program-verify mode or erase-verify mode for addresses H'00000 to H'3FFFF is entered by setting the SWE bit when FWE = 1, then setting the PV or EV bit. Program mode for addresses H'00000 to H'3FFFF is entered by setting the SWE bit when FWE = 1, then setting the PSU bit, and finally setting the P bit. Erase mode for addresses H'00000 to H'3FFFF is entered by setting the SWE bit when FWE = 1, then setting the ESU bit, and finally setting the E bit. FLMCR1 is initialized by a reset, and in hardware standby mode and software standby mode. Its initial value is H'80 when a high level is input to the FWE pin, and H'00 when a low level is input. In mode 6 the FWE pin must be fixed low since flash memory on-board programming modes are not supported. When the on-chip flash memory is disabled, a read access to this register will return H'00, and writes are invalid.

When setting bits 6 to 0 in this register, one bit must be set one at a time. Writes to the SWE bit in FLMCR1 are enabled only when FWE = 1; writes to bits ESU, PSU, EV, and PV only when FWE = 1 and SWE = 1; writes to the E bit only when FWE = 1, SWE = 1, and ESU = 1; and writes to the P bit only when FWE = 1, SWE = 1, and PSU = 1.

- Notes:
1. The programming and erase flowcharts must be followed when setting the bits in this register to prevent erroneous programming or erasing.
 2. Transitions are made to program mode, erase mode, program-verify mode, and erase-verify mode according to the settings in this register. When reading flash memory as normal on-chip ROM, bits 6 to 0 in this register must be cleared.

Bit 7—Flash Write Enable (FWE): Sets hardware protection against flash memory programming/erasing.

Bit 7 FWE	Description
0	When a low level is input to the FWE pin (hardware-protected state)
1	When a high level is input to the FWE pin

Bit 6—Software Write Enable (SWE): Enables or disables flash memory programming and erasing (This bit should be set when setting bits 5 to 0, EBR1 bits 7 to 0, and EBR2 bits 3 to 0).

Bit 6 SWE	Description
0	Programming/erasing disabled (Initial value)
1	Programming/erasing enabled [Setting condition] When FWE = 1

Note: Do not execute a SLEEP instruction while the SWE bit is set to 1.

Bit 5—Erase Setup (ESU): Prepares for a transition to erase mode. Set this bit to 1 before setting the E bit to 1 in FLMCR1 (Do not set the SWE, PSU, EV, PV, E, or P bit at the same time).

Bit 5 ESU	Description
0	Erase setup cleared (Initial value)
1	Erase setup [Setting condition] When FWE = 1 and SWE = 1

Bit 4—Program Setup (PSU): Prepares for a transition to program mode. Set this bit to 1 before setting the P bit to 1 in FLMCR1 (Do not set the SWE, ESU, EV, PV, E, or P bit at the same time).

Bit 4 PSU	Description	
0	Program setup cleared	(Initial value)
1	Program setup [Setting condition] When FWE = 1 and SWE = 1	

Bit 3—Erase-Verify Mode (EV): Selects erase-verify mode transition or clearing (Do not set the SWE, ESU, PSU, PV, E, or P bit at the same time).

Bit 3 EV	Description	
0	Erase-verify mode cleared	(Initial value)
1	Transition to erase-verify mode [Setting condition] When FWE = 1 and SWE = 1	

Bit 2—Program-Verify Mode (PV): Selects program-verify mode transition or clearing (Do not set the SWE, ESU, PSU, EV, E, or P bit at the same time).

Bit 2 PV	Description	
0	Program-verify mode cleared	(Initial value)
1	Transition to program-verify mode [Setting condition] When FWE = 1 and SWE = 1	

Bit 1—Erase Mode (E): Selects erase mode transition or clearing (Do not set the SWE, ESU, PSU, EV, PV, or P bit at the same time).

Bit 1

E	Description	
0	Erase mode cleared	(Initial value)
1	Transition to erase mode [Setting condition] When FWE = 1, SWE = 1, and ESU = 1	

Note: Do not access the flash memory while the E bit is set.

Bit 0—Program (P): Selects program mode transition or clearing (Do not set the SWE, ESU, PSU, EV, PV, or E bit at the same time).

Bit 0

P	Description	
0	Program mode cleared	(Initial value)
1	Transition to program mode [Setting condition] When FWE = 1, SWE = 1, and PSU = 1	

Note: Do not access the flash memory while the P bit is set.

18.3.2 Flash Memory Control Register 2 (FLMCR2)

Bit	7	6	5	4	3	2	1	0
	FLER	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

FLMCR2 is an 8-bit register used for flash memory operating mode control. FLMCR2 is initialized to H'00 by a reset, and in hardware standby mode and software standby mode. When the on-chip flash memory is disabled, a read will return H'00.

Note: FLMCR2 is a read-only register, and should not be written to.

Bit 7—Flash Memory Error (FLER): Indicates that an error has occurred during an operation on flash memory (programming or erasing). When FLER is set to 1, flash memory goes to the error-protection state.

Bit 7

FLER	Description
0	Flash memory is operating normally Flash memory program/erase protection (error protection) is disabled [Clearing condition] Reset ($\overline{\text{RES}}$ pin or WDT reset) or hardware standby mode (Initial value)
1	An error occurred during flash memory programming/erasing Flash memory program/erase protection (error protection) is enabled [Setting conditions] <ul style="list-style-type: none"> • When flash memory is read during programming/erasing (including a vector read or instruction fetch, but excluding a read of the RAM area overlapping flash memory space) • Immediately after the start of exception handling during programming/erasing (excluding reset, illegal instruction, trap instruction, and division-by-zero exception handling) • When a SLEEP instruction (including software standby) is executed during programming/erasing • When the bus is released during programming/erasing

Bits 6 to 0—Reserved: These bits are always read as 0.

18.3.3 Erase Block Register 1 (EBR1)

Bit	7	6	5	4	3	2	1	0
	EB7	EB6	EB5	EB4	EB3	EB2	EB1	EB0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

EBR1 is an 8-bit register that specifies the flash memory erase area block by block. EBR1 is initialized to H'00 by a reset, in hardware standby mode and software standby mode, when a low level is input to the FWE pin, and when a high level is input to the FWE pin and the SWE bit in FLMCR1 is not set. When a bit in EBR1 is set to 1, the corresponding block can be erased. Other blocks are erase-protected. Only one bit can be set in EBR1 and EBR2 together; do not set two or more bits at the same time. When the on-chip flash memory is disabled, a read access to this register will return H'00, and erasing is disabled.

The flash memory block configuration is shown in table 18.5. To erase the entire flash memory, each block must be erased in turn.

As the H8/3064F-ZTAT B-mask version does not support on-board programming modes in mode 6, EBR1 register bits cannot be set to 1 in this mode.

18.3.4 Erase Block Register 2 (EBR2)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	EB11	EB10	EB9	EB8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R/W	R/W	R/W	R/W

EBR2 is an 8-bit register that specifies the flash memory erase area block by block. EBR2 is initialized to H'00 by a reset, in hardware standby mode and software standby mode, and when a low level is input to the FWE pin. When a high level is input to the FWE pin and the SWE bit in FLMCR1 is not set, it is initialized to bit 0. When a bit in EBR2 is set to 1, the corresponding block can be erased. Other blocks are erase-protected. Only one bit can be set in EBR1 and EBR2 together; do not set two or more bits at the same time. When the on-chip flash memory is disabled, a read will return H'00, and erasing is disabled.

The flash memory block configuration is shown in table 18.5. To erase the entire flash memory, each block must be erased in turn.

As the H8/3064F-ZTAT B-mask version does not support on-board programming modes in mode 6, EBR2 register bits cannot be set to 1 in this mode.

Note: Bits 7 to 4 in this register are read-only. These bits must not be set to 1. If bits 7 to 4 are set when an EBR1/EBR2 bit is set, EBR1/EBR2 will be initialized to H'00.

Table 18.5 Flash Memory Erase Blocks

Block (Size)	Addresses
EB0 (4 kbytes)	H'000000 to H'000FFF
EB1 (4 kbytes)	H'001000 to H'001FFF
EB2 (4 kbytes)	H'002000 to H'002FFF
EB3 (4 kbytes)	H'003000 to H'003FFF
EB4 (4 kbytes)	H'004000 to H'004FFF
EB5 (4 kbytes)	H'005000 to H'005FFF
EB6 (4 kbytes)	H'006000 to H'006FFF
EB7 (4 kbytes)	H'007000 to H'007FFF
EB8 (32 kbytes)	H'008000 to H'00FFFF
EB9 (64 kbytes)	H'010000 to H'01FFFF
EB10 (64 kbytes)	H'020000 to H'02FFFF
EB11 (64 kbytes)	H'030000 to H'03FFFF

18.3.5 RAM Control Register (RAMCR)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	RAMS	RAM2	RAM1	RAM0
Initial value	1	1	1	1	0	0	0	0
Read/Write	R	R	R	R	R/W	R/W	R/W	R/W

RAMCR specifies the area of flash memory to be overlapped with part of RAM when emulating realtime flash memory programming. RAMCR is initialized to H'00 by a reset and in hardware standby mode. RAMCR settings should be made in user mode or user program mode.

Flash memory area divisions are shown in table 18.6. To ensure correct operation of the emulation function, the ROM for which RAM emulation is performed should not be accessed immediately after this register has been modified. Normal execution of an access immediately after register modification is not guaranteed.

Bits 7 to 4—Reserved: These bits cannot be modified and are always read as 1.

Bit 3—RAM Select (RAMS): Specifies selection or non-selection of flash memory emulation in RAM. When RAMS = 1, all flash memory blocks are program/erase-protected.

Bit 3

RAMS	Description
0	Emulation not selected Program/erase-protection of all flash memory blocks is disabled (Initial value)
1	Emulation selected Program/erase-protection of all flash memory blocks is enabled

Bits 2 to 0—Flash Memory Area Selection (RAM2 to RAM0): These bits are used together with bit 3 to select the flash memory area to be overlapped with RAM (See table 18.6).

Table 18.6 Flash Memory Area Divisions

RAM Area	Block Name	RAMS	RAM2	RAM1	RAM0
H'FFE000 to H'FFFEFF	4-kbyte RAM area	0	*	*	*
H'000000 to H'000FFF	EB0 (4 kbytes)	1	0	0	0
H'001000 to H'001FFF	EB1 (4 kbytes)	1	0	0	1
H'002000 to H'002FFF	EB2 (4 kbytes)	1	0	1	0
H'003000 to H'003FFF	EB3 (4 kbytes)	1	0	1	1
H'004000 to H'004FFF	EB4 (4 kbytes)	1	1	0	0
H'005000 to H'005FFF	EB5 (4 kbytes)	1	1	0	1
H'006000 to H'006FFF	EB6 (4 kbytes)	1	1	1	0
H'007000 to H'007FFF	EB7 (4 kbytes)	1	1	1	1

*: Don't care

Note: Flash memory emulation by RAM is not supported in mode 6 (single-chip normal mode); therefore, although these bits can be written, they should not be set to 1.

When performing flash memory emulation by RAM, the RAME bit in SYSCR must be set to 1.

18.4 Overview of Operation

18.4.1 Mode Transitions

When the mode pins and the FWE pin are set in the reset state and a reset-start is executed, the H8/3064F-ZTAT B-mask version enters one of the operating modes shown in figure 18.2. In user mode, flash memory can be read but not programmed or erased.

Flash memory can be programmed and erased in boot mode, user program mode, and PROM mode.

Boot mode and user program mode cannot be used in the H8/3064F-ZTAT B-mask version's mode 6 (normal mode with on-chip ROM enabled).

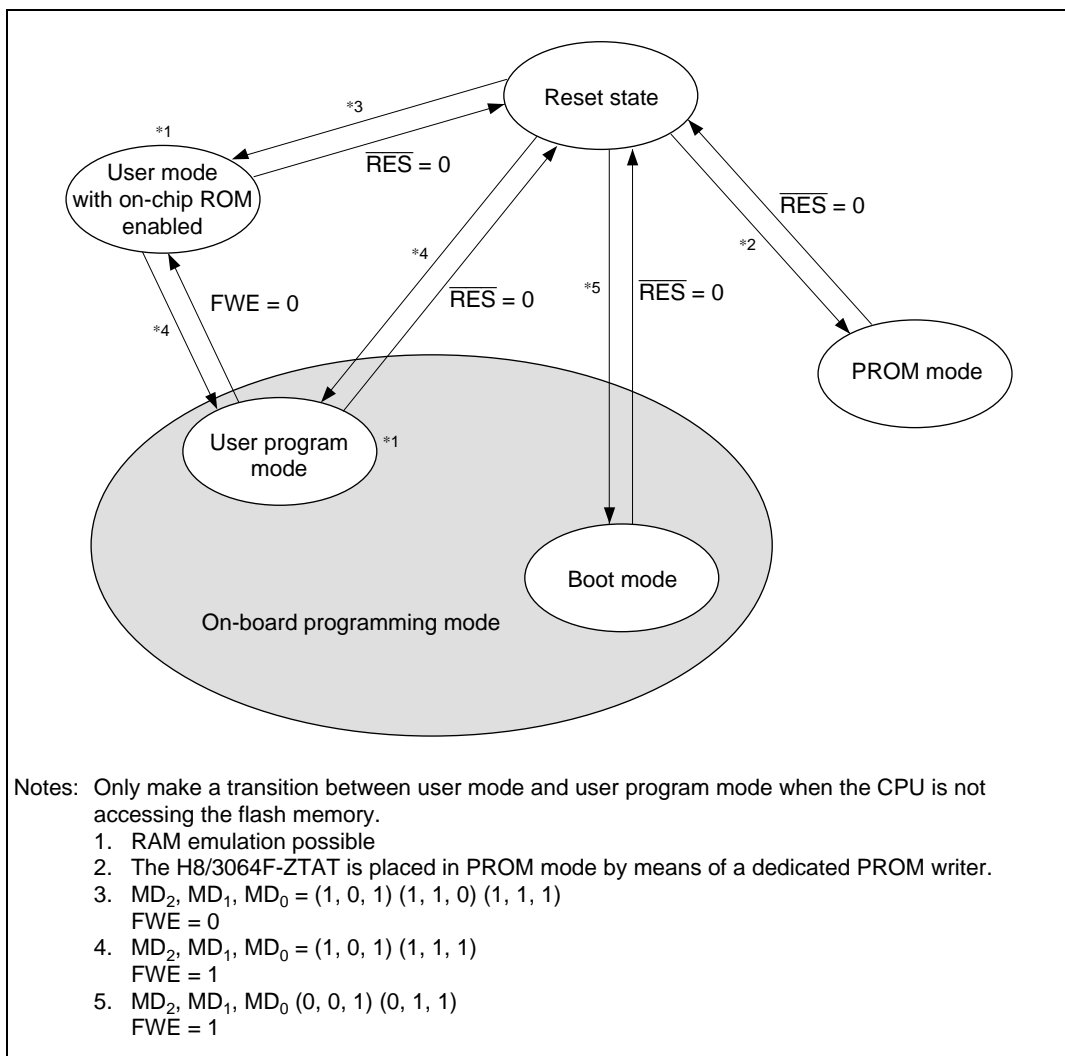

Figure 18.2 Flash Memory Related State Transitions

State transitions between the normal and user modes and on-board programming mode are performed by changing the FWE pin level from high to low or from low to high. To prevent misoperation (erroneous programming or erasing) in these cases, the bits in the flash memory control register (FLMCR1) should be cleared to 0 before making such a transition. After the bits are cleared, a wait time is necessary. Normal operation is not guaranteed if this wait time is insufficient.

18.4.2 On-Board Programming Modes

Example of Boot Mode Operation

1. Initial state
 The old program version or data remains written in the flash memory. The user should prepare the programming control program and new application program beforehand in the host.

2. Programming control program transfer
 When boot mode is entered, the boot program in the H8/3064F-ZTAT B-mask version (originally incorporated in the chip) is started and the programming control program in the host is transferred to RAM via SCI communication. The boot program required for flash memory erasing is automatically transferred to the RAM boot program area.

3. Flash memory initialization
 The erase program in the boot program area (in RAM) is executed, and the flash memory is initialized (to H'FF). In boot mode, total flash memory erasure is performed, without regard

4. Writing new application program
 The programming control program transferred from the host to RAM is executed, and the new application program in the host is written into the flash memory.

 Program execution state

Example of User Program Mode Operation

1. Initial state

The FWE assessment program that confirms that user program mode has been entered, and the program that will transfer the programming/erase control program from flash memory to on-chip RAM should be written into the flash memory by the user beforehand. The programming/erase control program should be prepared in the host or in the flash memory.

2. Programming/erase control program transfer

When user program mode is entered, user software recognizes this fact, executes the transfer program in the flash memory, and transfers the programming/erase control program to RAM.

3. Flash memory initialization

The programming/erase program in RAM is executed, and the flash memory is initialized (to H'FF). Erasing can be performed in block units, but not in byte units.

4. Writing new application program

Next, the new application program in the host is written into the erased flash memory blocks. Do not write to unerased blocks.

 Program execution state

18.4.3 Flash Memory Emulation in RAM

In the H8/3064F-ZTAT B-mask version, flash memory programming can be emulated in real time by overlapping the flash memory with part of RAM (“overlap RAM”). When the emulation block set in RAMCR is accessed while the emulation function is being executed, data written in the overlap RAM is read.

Emulation should be performed in user mode or user program mode.

Figure 18.3 Reading Overlap RAM Data in User Mode/User Program Mode

When overlap RAM data is confirmed, clear the RAMS bit to cancel RAM overlap, and actually perform writes to the flash memory in user program mode.

When the programming control program is transferred to RAM in on-board programming mode, ensure that the transfer destination and the overlap RAM do not overlap, as this will cause data in the overlap RAM to be rewritten.

Figure 18.4 Writing Overlap RAM Data in User Program Mode

18.4.4 Block Configuration

The flash memory in the H8/3064F-ZTAT B-mask version is divided into three 64-kbyte blocks, one 32-kbyte block, and eight 4-kbyte blocks. Erasing can be carried out in block units.

18.5 On-Board Programming Mode

When pins are set to on-board programming mode and a reset-start is executed, the chip enters the on-board programming state in which on-chip flash memory programming, erasing, and verifying can be carried out. There are two operating modes in this mode—boot mode and user program mode. The pin settings for entering each mode are shown in table 18.7. For a diagram of the transitions to the various flash memory modes, see figure 18.2.

Boot mode and user program mode cannot be used in the H8/3064F-ZTAT B-mask version's mode 6 (on-chip ROM enabled).

Table 18.7 On-Board Programming Mode Settings

Mode		FWE	MD ₂	MD ₁	MD ₀
Boot mode	Mode 5	1* ¹	0* ²	0	1
	Mode 7		0* ²	1	1
User program mode	Mode 5		1	0	1
	Mode 7		1	1	1

Notes: 1. For the High level input timing, see items 6 and 7 of "Notes on Using the Boot Mode" in section 18.5.1.

2. In boot mode, the MD₂ setting should be the inverse of the input.

In the boot mode in the H8/3064F-ZTAT B-mask version, the levels of the mode pins (MD₂ to MD₀) are reflected in mode select bits 2 to 0 (MDS2 to MDS0) in the mode control register (MDCR).

18.5.1 Boot Mode

When boot mode is used, a flash memory programming control program must be prepared beforehand in the host, and SCI channel 1, which is to be used, must be set to asynchronous mode.

When a reset-start is executed after setting the H8/3064F-ZTAT B-mask version's pins to boot mode, the boot program already incorporated in the MCU is activated, and the programming control program prepared beforehand in the host is transmitted sequentially to the H8/3064F-ZTAT B-mask version, using the SCI. In the H8/3064F-ZTAT B-mask version, the programming control program received via the SCI is written into the programming control program area in on-chip RAM. After the transfer is completed, control branches to the start address (H'FFE720) of the programming control program area and the programming control program execution state is entered (flash memory programming/erasing can be performed).

Figure 18.5 shows a system configuration diagram when using boot mode, and figure 18.6 shows the boot program mode execution procedure.

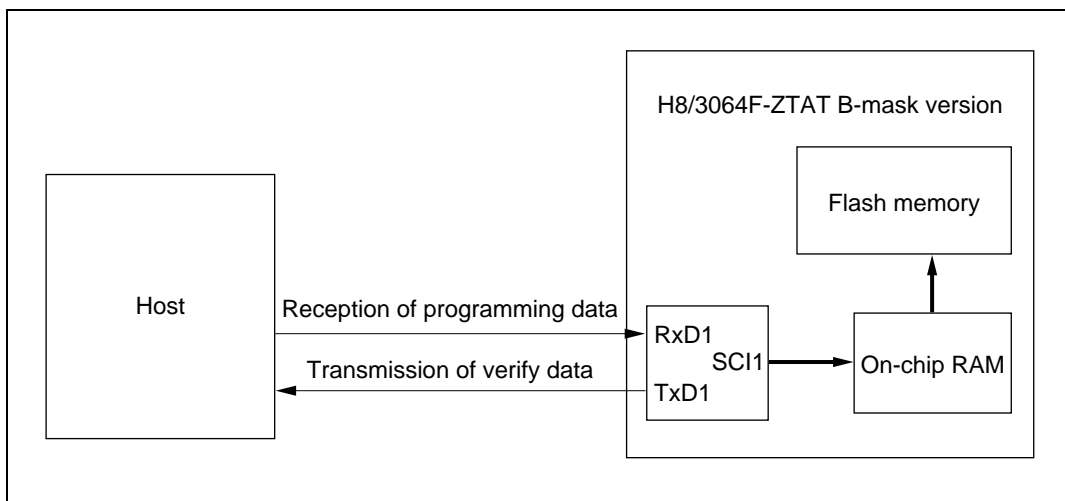

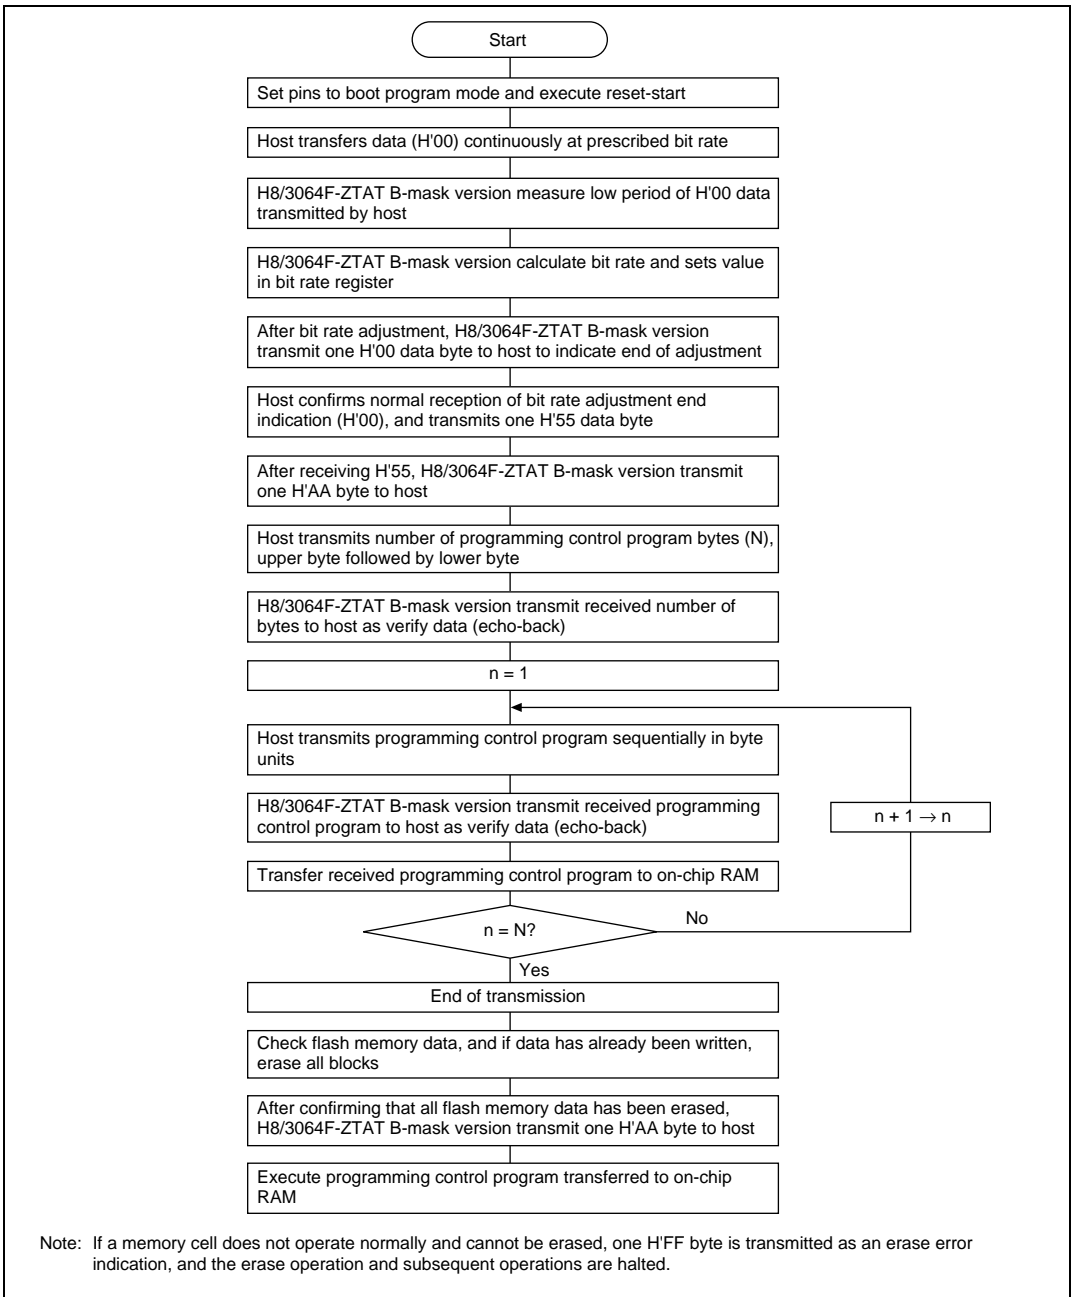

Figure 18.5 System Configuration When Using Boot Mode

Note: If a memory cell does not operate normally and cannot be erased, one H'FF byte is transmitted as an erase error indication, and the erase operation and subsequent operations are halted.

Figure 18.6 Boot Mode Execution Procedure

Automatic SCI Bit Rate Adjustment:

When boot mode is initiated, the H8/3064F-ZTAT B-mask version measure the low period of the asynchronous SCI communication data (H'00) transmitted continuously from the host. The SCI transmit/receive format should be set as 8-bit data, 1 stop bit, no parity. The H8/3064F-ZTAT B-mask version calculate the bit rate of the transmission from the host from the measured low period, and transmits one H'00 byte to the host to indicate the end of bit rate adjustment. The host should confirm that this adjustment end indication (H'00) has been received normally, and transmit one H'55 byte to the H8/3064F-ZTAT B-mask version. If reception cannot be performed normally, initiate boot mode again (reset), and repeat the above operations. Depending on the host's transmission bit rate and the H8/3064F-ZTAT B-mask version's system clock frequency, there will be a discrepancy between the bit rates of the host and the H8/3064F-ZTAT B-mask version. To ensure correct SCI operation, the host's transfer bit rate should be set to 4800, 9600, or 19,200 bps*.

Table 18.8 shows typical host transfer bit rates and system clock frequencies for which automatic adjustment of the H8/3064F-ZTAT B-mask version bit rate is possible. The boot program should be executed within this system clock range.

Table 18.8 System Clock Frequencies for which Automatic Adjustment of H8/3064F-ZTAT B-mask version Bit Rate is Possible

Host Bit Rate (bps)	System Clock Frequency for which Automatic Adjustment of H8/3064F-ZTAT B-Mask Version Bit Rate is Possible (MHz)
19,200	16 to 25
9,600	8 to 25
4,800	4 to 25

Note: * Only use a setting of 4800, 9600, or 19200 bps for the host's bit rate. No other settings can be used.

Although the H8/3064F-ZTAT B-mask version may also perform automatic bit rate adjustment with bit rate and system clock combinations other than those shown in table

18.8, a degree of error will arise between the bit rates of the host and the H8/3064F-ZTAT B-mask version, and subsequent transfer will not be performed normally. Therefore, only a combination of bit rate and system clock frequency within one of the ranges shown in table 18.8 can be used for boot mode execution.

On-Chip RAM Area Divisions in Boot Mode: In boot mode, the RAM area is divided into an area used by the boot program and an area to which the user program is transferred via the SCI, as shown in figure 18.7. The boot program area becomes available when a transition is made to the execution state for the user program transferred to RAM.

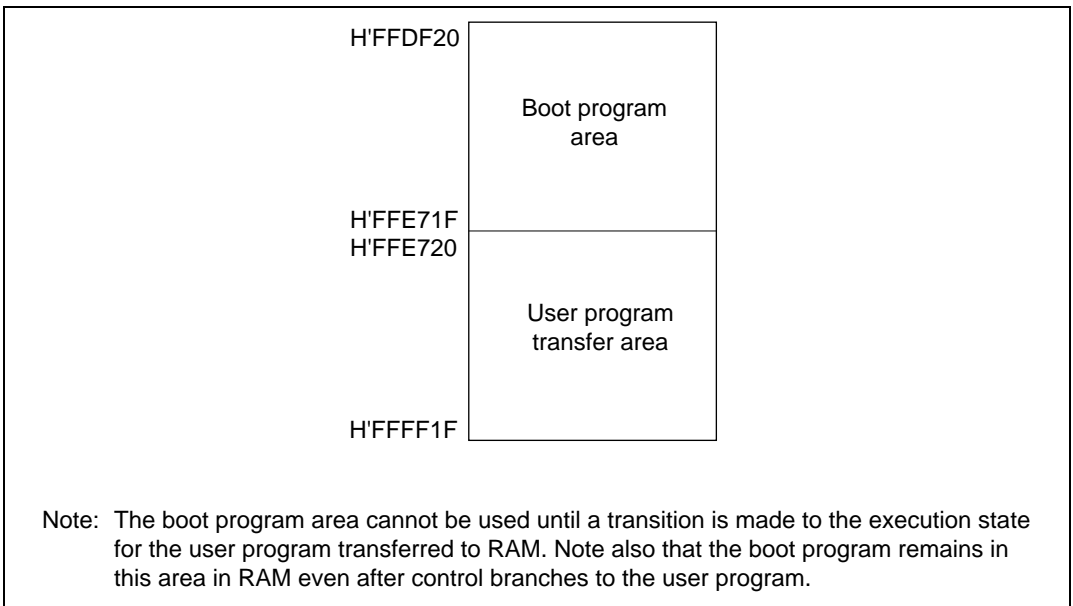

Figure 18.7 RAM Areas in Boot Mode

Notes on Use of Boot Mode:

1. When the H8/3064F-ZTAT B-mask version chip comes out of reset in boot mode, it measures the low period of the input at the SCI's RxD₁ pin. The reset should end with RxD₁ high. After the reset ends, it takes about 100 states for the chip to get ready to measure the low period of the RxD₁ input.
2. In boot mode, if any data has been programmed into the flash memory (if all data is not 1), all flash memory blocks are erased. Boot mode is for use when user program mode is unavailable, such as the first time on-board programming is performed, or if the program activated in user program mode is accidentally erased.

3. Interrupts cannot be used while the flash memory is being programmed or erased.
4. The RxD_1 and TxD_1 lines should be pulled up on the board.
5. Before branching to the user program the H8/3064F-ZTAT B-mask version terminates transmit and receive operations by the on-chip SCI (channel 1) (by clearing the RE and TE bits to 0 in the serial control register (SCR)), but the adjusted bit rate value remains set in the bit rate register (BRR). The transmit data output pin, TxD_1 , goes to the high-level output state ($P9_1DDR = 1$ in P9DDR, $P9_1DR = 1$ in P9DR).

The contents of the CPU's internal general registers are undefined at this time, so these registers must be initialized immediately after branching to the user program. In particular, since the stack pointer (SP) is used implicitly in subroutine calls, etc., a stack area must be specified for use by the user program.

The initial values of other on-chip registers are not changed.

6. Boot mode can be entered by setting pins MD_0 to MD_2 and FWE in accordance with the mode setting conditions shown in table 18.6, and then executing a reset-start.
 - a. When switching from boot mode to normal mode, the boot mode state within the chip must first be cleared by reset input via the \overline{RES} pin*¹. The \overline{RES} pin must be held low for at least 20 system clock cycles*³.
 - b. Do not change the input levels of the mode pins (MD_2 to MD_0) or the FWE pin in boot mode. To change the mode, the \overline{RES} pin must first be driven low to set the reset state. Also, if a watchdog timer reset occurs in the boot mode state, the MCU's internal state will not be cleared, and the on-chip boot program will be restarted regardless of the mode pin states.
 - c. The FWE pin must not be driven low while the boot program is running or flash memory is being programmed or erased*².
7. If the mode pin input levels are changed (for example, from low to high) during a reset, the state of ports with multiplexed address functions and bus control output signals (\overline{CSn} , \overline{AS} , \overline{RD} , \overline{LWR} , \overline{HWR}) may also change according to the change in the MCU's operating mode. Therefore, care must be taken to make pin settings to prevent these pins from being used directly as output signal pins during a reset, or to prevent collision with signals outside the MCU.

- Notes:
1. Mode pin and FWE pin input must satisfy the mode programming setup time (t_{MDS}) with respect to the reset release timing.
 2. For further information on FWE application and disconnection, see section 18.11, Flash Memory Programming and Erasing Precautions.
 3. See section 4.2.2, Reset Sequence, and section 18.11, Flash Memory Programming and Erasing Precautions. The H8/3064F-ZTAT B-mask version requires a minimum of 20 system clock cycles for a reset during operation.

18.5.2 User Program Mode

When set to user program mode, the H8/3064F-ZTAT B-mask version can program and erase its flash memory by executing a user program/erase control program. Therefore, on-board reprogramming of the on-chip flash memory can be carried out by providing on-board means of FWE control and supply of programming data, and storing a program/erase control program in part of the program area as necessary.

To select user program mode, select a mode that enables the on-chip ROM (mode 5 or 7), and apply a high level to the FWE pin. In this mode, on-chip supporting modules other than flash memory operate as they normally would in modes 5 and 7.

Flash memory programming/erasing should not be carried out in mode 6. When mode 6 is set, the FWE pin must be driven low.

The flash memory itself cannot be read while being programmed or erased, so the program that performs programming should be placed in external memory or transferred to RAM and executed there.

Figure 18.8 shows the execution procedure when user program mode is entered during program execution in RAM. It is also possible to start from user program mode in a reset-start.

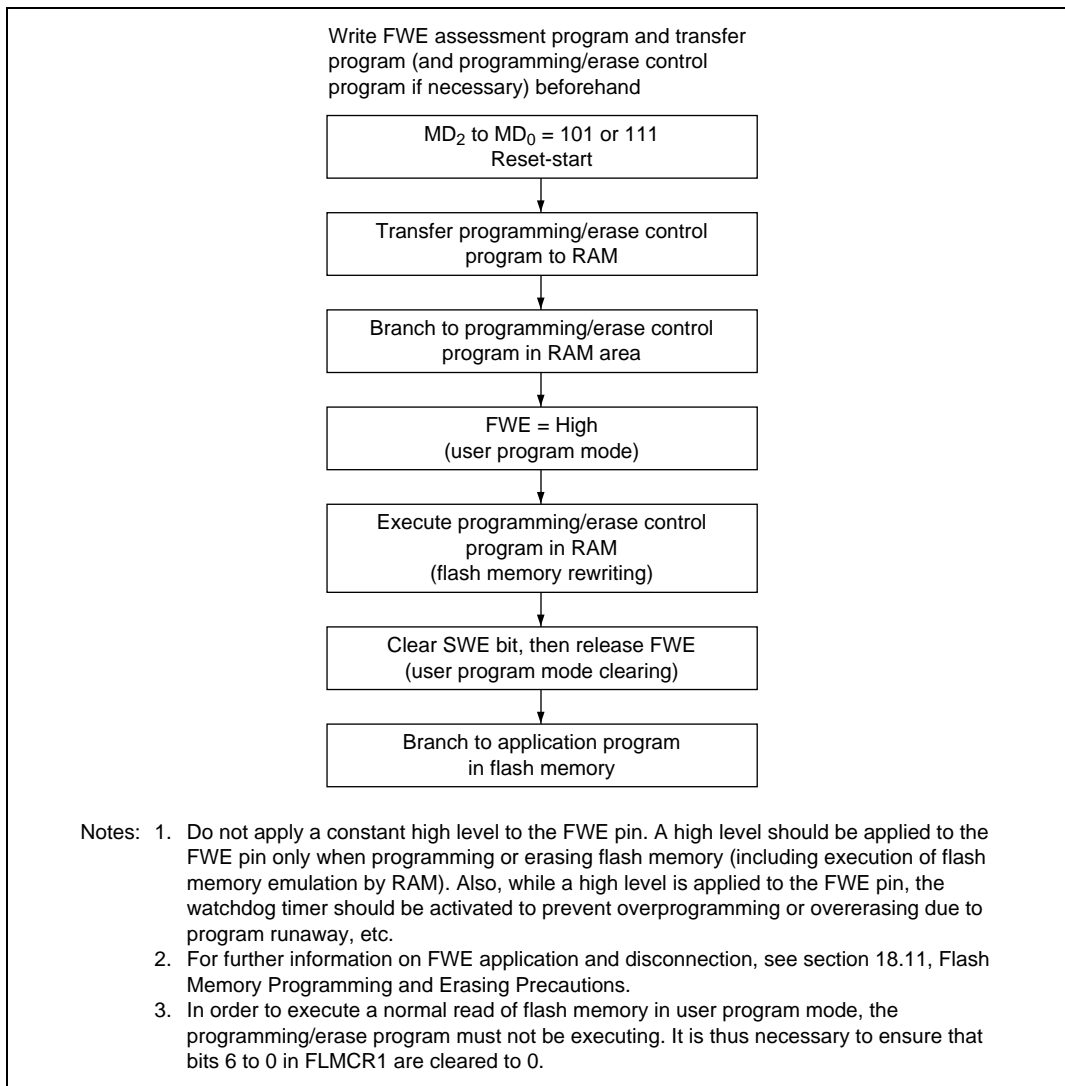

Figure 18.8 Example of User Program Mode Execution Procedure

18.6 Flash Memory Programming/Erasing

A software method, using the CPU, is employed to program and erase flash memory in the on-board programming modes. There are four flash memory operating modes: program mode, erase mode, program-verify mode, and erase-verify mode. Transitions to these modes for addresses H'000000 to H'03FFFF are made by setting the PSU, ESU, P, E, PV, and EV bits in FLMCR1.

The flash memory cannot be read while being programmed or erased. Therefore, the program (user program) that controls flash memory programming/erasing should be located and executed in on-chip RAM or external memory.

See section 18.11, Flash Memory Programming and Erasing Precautions, for points to be noted when programming or erasing the flash memory. In the following operation descriptions, wait times after setting or clearing individual bits in FLMCR1 are given as parameters; for details of the wait times, see section 22.3.6, Flash Memory Characteristics.

- Notes:
1. Operation is not guaranteed if setting/resetting of the SWE, ESU, PSU, EV, PV, E, and P bits in FLMCR1 is executed by a program in flash memory.
 2. When programming or erasing, set FWE to 1 (programming/erasing will not be executed if FWE = 0).
 3. Programming must be executed in the erased state. Do not perform additional programming on addresses that have already been programmed.

Figure 18.9 FLMCR1 Bit Settings and State Transitions

18.6.1 Program Mode

When writing data or programs to flash memory, the program/program-verify flowchart shown in figure 18.10 should be followed. Performing programming operations according to this flowchart will enable data or programs to be written to flash memory without subjecting the device to voltage stress or sacrificing program data reliability. Programming should be carried out 128 bytes at a time.

The wait times after bits are set or cleared in the flash memory control register 1 (FLMCR1) and the maximum number of programming operations (N) are shown in table 22.30 in section 22.3.6, Flash Memory Characteristics.

Following the elapse of (t_{sswe}) μ s or more after the SWE bit is set to 1 in FLMCR1, 128-byte data is written consecutively to the write addresses. The lower 8 bits of the first address written to must be H'00 and H'80, 128 consecutive byte data transfers are performed. The program address and program data are latched in the flash memory. A 128-byte data transfer must be performed even if writing fewer than 128 bytes; in this case, H'FF data must be written to the extra addresses.

Next, the watchdog timer (WDT) is set to prevent overprogramming due to program runaway, etc. Set a value greater than ($t_{spsu} + t_{sp} + t_{cp} + t_{cpsu}$) μ s as the WDT overflow period. Preparation for entering program mode (program setup) is performed next by setting the PSU bit in FLMCR1. The operating mode is then switched to program mode by setting the P bit in FLMCR1 after the elapse of at least (t_{spsu}) μ s. The time during which the P bit is set is the flash memory programming time. Make a program setting so that the time for one programming operation is within the range of (t_{sp}) μ s.

The wait time after P bit setting must be changed according to the degree of progress through the programming operation. For details see “Notes on Program/Program-Verify Procedure” in section 18.6.2.

18.6.2 Program-Verify Mode

In program-verify mode, the data written in program mode is read to check whether it has been correctly written in the flash memory.

After the elapse of the given programming time, clear the P bit in FLMCR1, then wait for at least (t_{cp}) μ s before clearing the PSU bit to exit program mode. After exiting program mode, the watchdog timer setting is also cleared. The operating mode is then switched to program-verify mode by setting the PV bit in FLMCR1. Before reading in program-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (t_{spv}) μ s or more. When the flash memory is read in this state (verify data is read

in 16-bit units), the data at the latched address is read. Wait at least (t_{spvr}) μs after the dummy write before performing this read operation. Next, the originally written data is compared with the verify data, and reprogram data is computed (see figure 18.10) and transferred to RAM. After verification of 128 bytes of data has been completed, exit program-verify mode, wait for at least (t_{cpv}) μs , then clear the SWE bit in FLMCR1. If reprogramming is necessary, set program mode again, and repeat the program/program-verify sequence as before. The maximum number of repetitions of the program/program-verify sequence is indicated by the maximum programming count (N). Leave a wait time of at least (t_{cswe}) μs after clearing SWE.

Notes on Program/Program-Verify Procedure

1. The program/program-verify procedure for the H8/3064F-ZTAT B-mask version uses a 128-byte-unit programming algorithm.
Note that this is different from the procedure in the H8/3062F-ZTAT R-mask version (32-byte-unit programming).
In order to perform 128-byte-unit programming, the lower 8 bits of the write start address must be H'00 or H'80.
2. When performing continuous writing of 128-byte data to flash memory, byte-unit transfer should be used.
128-byte data transfer is necessary even when writing fewer than 128 bytes of data. Write H'FF data to the extra addresses.
3. Verify data is read in word units.
4. The write pulse is applied and a flash memory write executed while the P bit in FLMCR1 is set. In the H8/3064F-ZTAT B-mask version, write pulses should be applied as follows in the program/program-verify procedure to prevent voltage stress on the device and loss of write data reliability.
 - a. After write pulse application, perform a verify-read in program-verify mode and apply a write pulse again for any bits read as 1 (reprogramming processing). When all the 0-write bits in the 128-byte write data are read as 0 in the verify-read operation, the program/program-verify procedure is completed. In the H8/3064F-ZTAT B-mask version, the number of loops in reprogramming processing is guaranteed not to exceed the maximum value of the maximum programming count (N).
 - b. After write pulse application, a verify-read is performed in program-verify mode, and programming is judged to have been completed for bits read as 0. The following processing is necessary for programmed bits.
When programming is completed at an early stage in the program/program-verify procedure:

If programming is completed in the 1st to 6th reprogramming processing loop, additional programming should be performed on the relevant bits. Additional programming should only be performed on bits which first return 0 in a verify-read in certain reprogramming processing.

When programming is completed at a late stage in the program/program-verify procedure: If programming is completed in the 7th or later reprogramming processing loop, additional programming is not necessary for the relevant bits.

- c. If programming of other bits is incomplete in the 128 bytes, reprogramming processing should be executed. If a bit for which programming has been judged to be completed is read as 1 in a subsequent verify-read, a write pulse should again be applied to that bit.
5. The period for which the P bit in FLMCR1 is set (the write pulse width) should be changed according to the degree of progress through the program/program-verify procedure. For detailed wait time specifications, see section 22.3.6, Flash Memory Characteristics.

Item	Symbol	Item	Symbol
Wait time after P bit setting	t_{sp}	When reprogramming loop count (n) is 1 to 6	$t_{sp}30$
		When reprogramming loop count (n) is 7 or more	$t_{sp}200$
		In case of additional programming processing*	$t_{sp}10$

Note: * Additional programming processing is necessary only when the reprogramming loop count (n) is 1 to 6.

6. The program/program-verify flowchart for the H8/3064F-ZTAT B-mask version is shown in figure 18.10.

To cover the points noted above, bits on which reprogramming processing is to be executed, and bits on which additional programming is to be executed, must be determined as shown below.

Since reprogram data and additional-programming data vary according to the progress of the programming procedure, it is recommended that the following data storage areas (128 bytes each) be provided in RAM.

Reprogram Data Computation Table

(D)	Result of Verify-Read after Write Pulse Application (V)	(X) Result of Operation	Comments
0	0	1	Programming completed: reprogramming processing not to be executed
0	1	0	Programming incomplete: reprogramming processing to be executed
1	0	1	—
1	1	1	Still in erased state: no action

Legend:

(D): Source data of bits on which programming is executed

(X): Source data of bits on which reprogramming is executed

Additional-Programming Data Computation Table

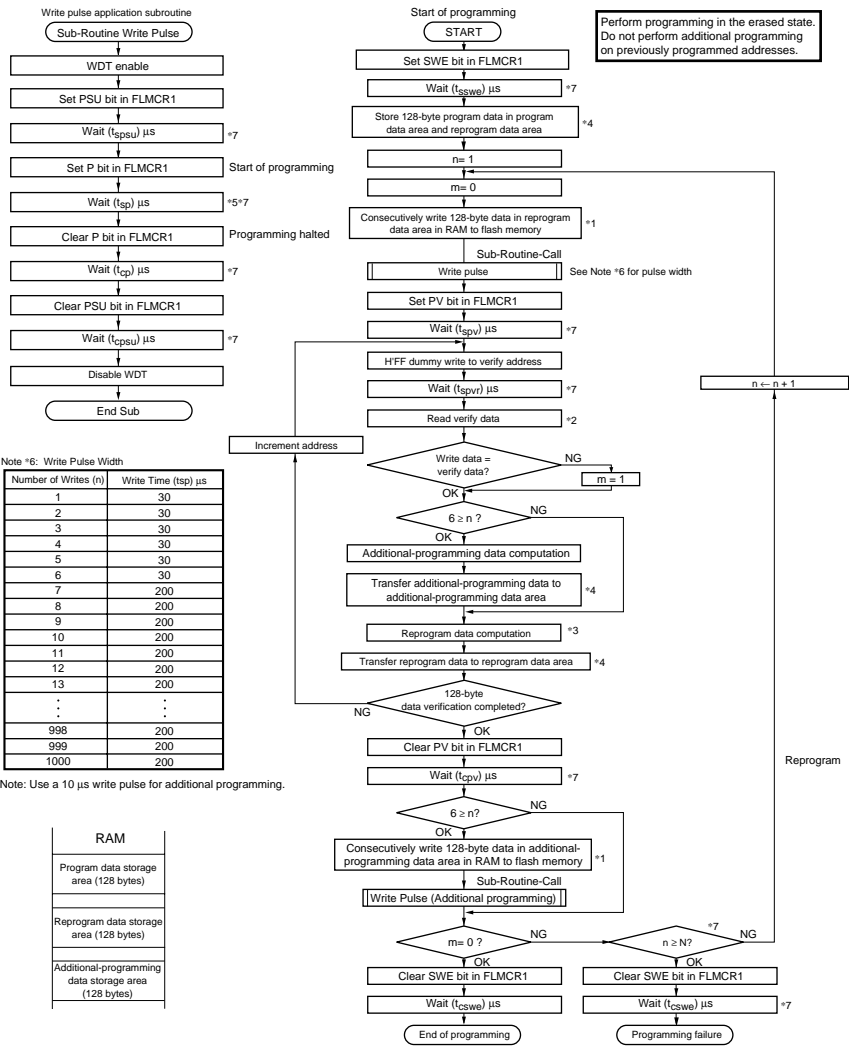

(X')	Result of Verify-Read after Write Pulse Application (V)	(Y) Result of Operation	Comments
0	0	0	Programming by write pulse application judged to be completed: additional programming processing to be executed
0	1	1	Programming by write pulse application incomplete: additional programming processing not to be executed
1	0	1	Programming already completed: additional programming processing not to be executed
1	1	1	Still in erased state: no action

Legend:

(X'): Data of bits on which reprogramming is executed in a certain reprogramming loop

(Y): Data of bits on which additional programming is executed

- It is necessary to execute additional programming processing during the course of the H8/3064F-ZTAT B-mask version program/program-verify procedure. However, once 128-byte-unit programming is finished, additional programming should not be carried out on the same address area. When executing reprogramming, an erase must be executed first. Note that normal operation of reads, etc., is not guaranteed if additional programming is performed on addresses for which a program/program-verify operation has finished.

Note #6: Write Pulse Width

Number of Writes (n)	Write Time (tsp) μs
1	30
2	30
3	30
4	30
5	30
6	30
7	200
8	200
9	200
10	200
11	200
12	200
13	200
.	.
998	200
999	200
1000	200

Note: Use a 10 μs write pulse for additional programming.

RAM
Program data storage area (128 bytes)
Reprogram data storage area (128 bytes)
Additional-programming data storage area (128 bytes)

- Notes:
- Data transfer is performed by byte transfer. The lower 8 bits of the first address written to must be H00 or H80. A 128-byte data transfer must be performed even if writing fewer than 128 bytes; in this case, HFF data must be written to the extra addresses.
 - Verify data is read in 16-bit (word) units.
 - Reprogram data is determined by the operation shown in the table below (comparison between the data stored in the program data area and the verify data). Bits for which the reprogram data is 0 are programmed in the next reprogramming loop. Therefore, even bits for which programming has been completed will be subjected to programming once again if the result of the subsequent verify operation is NG.
 - A 128-byte area for storing program data, a 128-byte area for storing reprogram data, and a 128-byte area for storing additional-programming data must be provided in RAM. The contents of the reprogram data area and additional-programming data area are modified as programming proceeds.
 - A write pulse of 30 μs or 200 μs is applied according to the progress of the programming operation. See Note 6 for details of the pulse widths. When writing of additional-programming data is executed, a 10 μs write pulse should be applied. Reprogram data 'X' means reprogram data when the write pulse is applied.
 - The wait times and value of N are shown in section 22.3.6, Flash Memory.

Reprogram Data Computation Table

Original Data (D)	Verify Data (V)	Reprogram Data (X)	Comments
0	0	1	Programming completed
0	1	0	Programming incomplete; reprogram
1	0	1	
1	1	1	Still in erased state; no action

Additional-Programming Data Computation Table

Reprogram Data (X)	Verify Data (V)	Additional-Programming Data (Y)	Comments
0	0	0	Additional programming to be executed
0	1	1	Additional programming not to be executed
1	0	1	Additional programming not to be executed
1	1	1	Additional programming not to be executed

Figure 18.10 Program/Program-Verify Flowchart (128-Byte Programming)

18.6.3 Erase Mode

When erasing flash memory, the single-block erase flowchart shown in figure 18.11 should be followed.

The wait times after bits are set or cleared in the flash memory control register 1 (FLMCR1) and the maximum number of erase operations (N) are shown in table 22.30 in section 22.3.6, Flash Memory Characteristics.

To erase flash memory contents, make a 1-bit setting for the flash memory area to be erased in erase block register 1 and 2 (EBR1, EBR2) at least (t_{sswe}) μ s after setting the SWE bit to 1 in FLMCR1. Next, the watchdog timer (WDT) is set to prevent overerasing due to program runaway, etc. Set a value greater than (t_{se}) ms + ($t_{sesu} + t_{ce} + t_{cesu}$) μ s as the WDT overflow period. Preparation for entering erase mode (erase setup) is performed next by setting the ESU bit in FLMCR1. The operating mode is then switched to erase mode by setting the E bit in FLMCR1 after the elapse of at least (t_{sesu}) μ s. The time during which the E bit is set is the flash memory erase time. Ensure that the erase time does not exceed (t_{se}) ms.

Note: With flash memory erasing, preprogramming (setting all memory data in the memory to be erased to all 0) is not necessary before starting the erase procedure.

18.6.4 Erase-Verify Mode

In erase-verify mode, data is read after memory has been erased to check whether it has been correctly erased.

After the elapse of the fixed erase time, clear the E bit in FLMCR1, then wait for at least (t_{ce}) μ s before clearing the ESU bit to exit erase mode. After exiting erase mode, the watchdog timer setting is also cleared. The operating mode is then switched to erase-verify mode by setting the EV bit in FLMCR1. Before reading in erase-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (t_{sev}) μ s or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (t_{sev}) μ s after the dummy write before performing this read operation. If the read data has been erased (all 1), a dummy write is performed to the next address, and erase-verify is performed. If the read data is unerased, set erase mode again, and repeat the erase/erase-verify sequence as before. The maximum number of repetitions of the erase/erase-verify sequence is indicated by the maximum erase count (N). When verification is completed, exit erase-verify mode, and wait for at least (t_{cev}) μ s. If erasure has been completed on all the erase blocks, clear the SWE bit in FLMCR1, and leave a wait time of at least (t_{cswe}) μ s.

If erasing multiple blocks, set a single bit in EBR1/EBR2 for the next block to be erased, and repeat the erase/erase-verify sequence as before.

Figure 18.11 Erase/Eraser-Verify Flowchart (Single-Block Erasing)

18.7 Flash Memory Protection

There are three kinds of flash memory program/erase protection: hardware, software, and error protection.

18.7.1 Hardware Protection

Hardware protection refers to a state in which programming/erasing of flash memory is forcibly disabled or aborted. In this state, the settings in flash memory control register 1 (FLMCR1) and erase block registers 1 and 2 (EBR1, EBR2) are reset. In the error protection state, the FLMCR1, EBR1, and EBR2 settings are retained; the P bit and E bit can be set, but a transition is not made to program mode or erase mode (See table 18.9).

Table 18.9 Hardware Protection

Item	Description	Function		
		Program	Erase	Verify
FWE pin protection	<ul style="list-style-type: none"> When a low level is input to the FWE pin, FLMCR1, EBR1, and EBR2 are initialized, and the program/erase-protected state is entered. 	Not possible*1	Not possible*3	Not possible
Reset/standby protection	<ul style="list-style-type: none"> In a reset (including a WDT overflow reset) and in standby mode, FLMCR1, FLMCR2, EBR1, and EBR2 are initialized, and the program/erase-protected state is entered. In a reset via the $\overline{\text{RES}}$ pin, the reset state is not entered unless the $\overline{\text{RES}}$ pin is held low until oscillation stabilizes after powering on. In the case of a reset during operation, hold the $\overline{\text{RES}}$ pin low for the $\overline{\text{RES}}$ pulse width specified in the AC Characteristics section*4. 	Not possible	Not possible*3	Not possible
Error protection	<ul style="list-style-type: none"> When a microcomputer operation error (error generation (FLER = 1)) was detected while flash memory was being programmed/erased, error protection is enabled. At this time, the FLMCR1, EBR1, and EBR2 settings are held, but programming/erasing is aborted at the time the error was generated. Error protection is released only by a reset via the $\overline{\text{RES}}$ pin or a WDT reset, or in the hardware standby mode. 	Not possible	Not possible*3	Possible*2

- Notes:
1. The RAM area that overlapped flash memory is deleted.
 2. It is possible to perform a program-verify operation on the 128 bytes being programmed, or an erase-verify operation on the block being erased.
 3. All blocks are unerasable and block-by-block specification is not possible.
 4. See section 4.2.2, Reset Sequence, and section 18.11, Flash Memory Programming and Erasing Precautions. The H8/3064F-ZTAT B-mask version requires a minimum of 20 system clock cycles for a reset during operation.

18.7.2 Software Protection

Software protection can be implemented by setting the erase block register 1 (EBR1), erase block register 2 (EBR2), and the RAMS bit in the RAM control register (RAMCR). With software protection, setting the P or E bit in the flash memory control register 1 (FLMCR1) does not cause a transition to program mode or erase mode (See table 18.10).

Table 18.10 Software Protection

Item	Description	Functions		
		Program	Erase	Verify
Block protection	<ul style="list-style-type: none"> • Erase protection can be set for individual blocks by settings in erase block register 1 (EBR1) and erase block register 2 (EBR2)*². However, programming protection is disabled. • Setting EBR1 and EBR2 to H'00 places all blocks in the erase-protected state. 	—	Not possible	Possible
Emulation protection	<ul style="list-style-type: none"> • Setting the RAMS bit 1 in RAMCR places all blocks in the program/erase-protected state. 	Not possible* ¹	Not possible* ³	Possible

- Notes:
1. The RAM area overlapping flash memory can be written to.
 2. When not erasing, set EBR1 and EBR2 to H'00.
 3. All blocks are unerasable and block-by-block specification is not possible.

18.7.3 Error Protection

In error protection, an error is detected when MCU runaway occurs during flash memory programming/erasing*¹, or operation is not performed in accordance with the program/erase algorithm, and the program/erase operation is aborted. Aborting the program/erase operation prevents damage to the flash memory due to overprogramming or overerasing.

If the MCU malfunctions during flash memory programming/erasing, the FLER bit is set to 1 in the flash memory status register (FLMSR2) and the error protection state is entered. FLMCR1, FLMCR2, EBR1, and EBR2 settings*³ are retained, but program mode or erase mode is aborted at the point at which the error occurred. Program mode or erase mode cannot be re-entered by re-setting the P or E bit in FLMCR. However, PV and EV bit setting is enabled, and a transition can be made to verify mode*².

FLER bit setting conditions are as follows:

1. When flash memory is read during programming/erasing (including a vector read or instruction fetch)
2. Immediately after the start of exception handling during programming/erasing (excluding reset, illegal instruction, trap instruction, and division-by-zero exception handling)
3. When a SLEEP instruction (including software standby) is executed during programming/erasing
4. When the bus is released during programming/erasing

Error protection is released only by a $\overline{\text{RES}}$ pin or WDT reset, or in hardware standby mode.

- Notes:
1. State in which the P bit or E bit in FLMCR1 is set to 1. Note that NMI input is disabled in this state.
 2. It is possible to perform a program-verify operation on the 128 bytes being programmed, or an erase-verify on the block being erased.
 3. FLMCR1, EBR1, and EBR2 can be written to. However, the registers are initialized if a transition is made to software standby mode while in the error protection state.

Figure 18.12 shows the flash memory state transition diagram.

Figure 18.12 Flash Memory State Transitions
(When High Level is Applied to FWE Pin in Mode 5 or 7 (On-Chip ROM Enabled))

The error protection function is invalid for abnormal operations other than the FLER bit setting conditions. Also, if a certain time has elapsed before this protection state is entered, damage may already have been caused to the flash memory. Consequently, this function cannot provide complete protection against damage to flash memory.

To prevent such abnormal operations, therefore, it is necessary to ensure correct operation in accordance with the program/erase algorithm, with the flash write enable (FWE) voltage applied, and to conduct constant monitoring for MCU errors, internally and externally, using the watchdog timer or other means. There may also be cases where the flash memory is in an erroneous programming or erroneous erasing state at the point of transition to this protection mode, or where programming or erasing is not properly carried out because of an abort. In cases such as these, a forced recovery (program rewrite) must be executed using boot mode. However, it may also happen that boot mode cannot be normally initiated because of overprogramming or overerasing.

18.8 Flash Memory Emulation in RAM

Making a setting in the RAM control register (RAMCR) enables part of RAM to be overlapped onto the flash memory area so that data to be written to flash memory can be emulated in RAM in real time. After the RAMCR setting has been made, accesses can be made from the flash memory area or the RAM area overlapping flash memory. Emulation can be performed in user mode and user program mode. Figure 18.13 shows an example of emulation of realtime flash memory programming.

Figure 18.13 Flowchart of Flash Memory Emulation in RAM

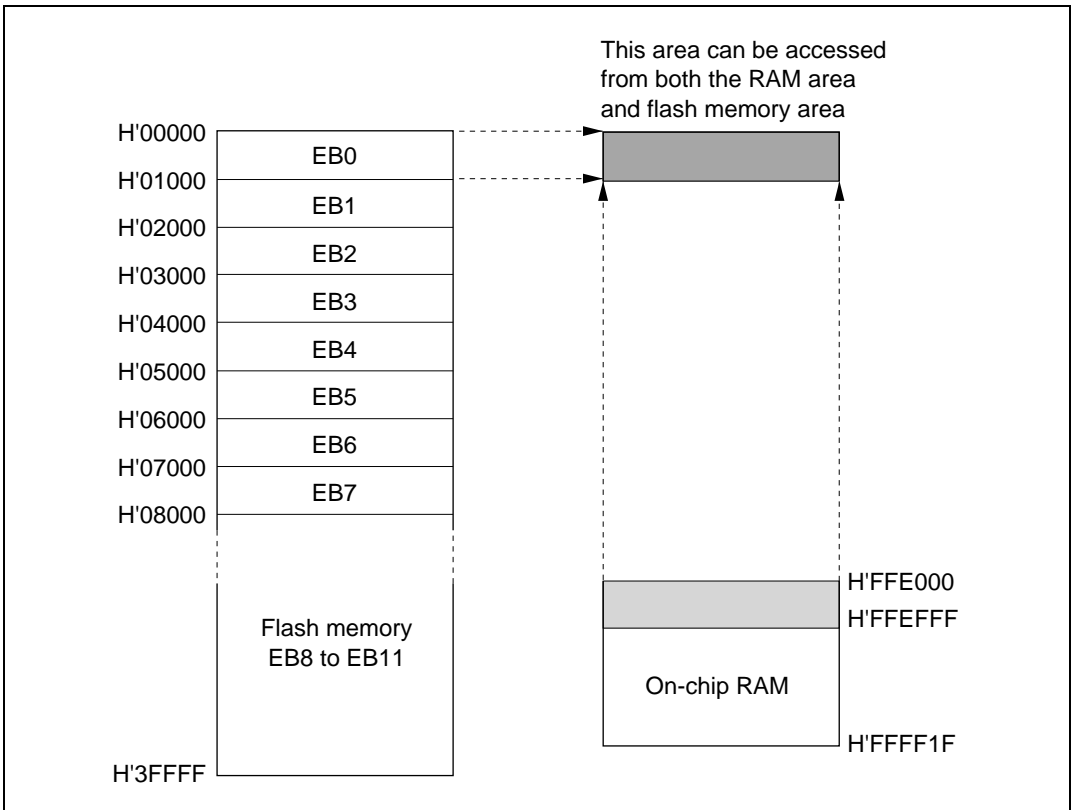

Figure 18.14 Example of RAM Overlap Operation

Example of Flash Memory Block Area EB0 Overlapping

1. Set bits RAMS and RAM2 to RAM0 in RAMCR to 1,0, 0, 0, to overlap part of RAM onto the area (EB0) for which realtime programming is required.
2. Realtime programming is performed using the overlapping RAM.
3. After the program data has been confirmed, the RAMS bit is cleared, releasing RAM overlap.
4. The data written in the overlapping RAM is written into the flash memory space (EB0).

- Notes:
1. When the RAMS bit is set to 1, program/erase protection is enabled for all blocks regardless of the value of RAM2 to RAM0 (emulation protection). In this state, setting the P or E bit in FLMCR1 will not cause a transition to program mode or erase mode. When actually programming or erasing a flash memory area, the RAMS bit should be cleared to 0.
 2. A RAM area cannot be erased by execution of software in accordance with the erase algorithm while flash memory emulation in RAM is being used.
 3. Block area EB0 contains the vector table. When performing RAM emulation, the vector table is needed in the overlap RAM.
 4. As in on-board programming mode, care is required when applying and releasing FWE to prevent erroneous programming or erasing. To prevent erroneous programming and erasing due to program runaway during FWE application, in particular, the watchdog timer should be set when the PSU, P, ESU, or E bit is set to 1 in FLMCR1, even while the emulation function is being used.
 5. When the emulation function is used, NMI input is prohibited when the P bit or E bit is set to 1 in FLMCR1, in the same way as with normal programming and erasing. The P and E bits are cleared by a reset (including a watchdog timer reset), in standby mode, when a high level is not being input to the FWE pin, or when the SWE bit in FLMCR1 is 0 while a high level is being input to the FWE pin.

18.9 NMI Input Disabling Conditions

All interrupts, including NMI input, should be disabled while flash memory is being programmed or erased (while the P bit or E bit is set in FLMCR1), and while the boot program is executing in boot mode^{*1}, to give priority to the program or erase operation. There are three reasons for this:

1. NMI input during programming or erasing might cause a violation of the programming or erasing algorithm, with the result that normal operation could not be assured.
2. In the NMI exception handling sequence during programming or erasing, the vector would not be read correctly^{*2}, possibly resulting in MCU runaway.
3. If NMI input occurred during boot program execution, it would not be possible to execute the normal boot mode sequence.

For these reasons, in on-board programming mode alone there are conditions for disabling NMI input, as an exception to the general rule. However, this provision does not guarantee normal erasing and programming or MCU operation. All interrupt requests (exception handling and bus release), including NMI, must therefore be restricted inside and outside the MCU during FWE application. NMI input is also disabled in the error protection state and while the P or E bit remains set in FLMCR1 during flash memory emulation in RAM.

- Notes:
1. This is the interval until a branch is made to the boot program area in the on-chip RAM (This branch takes place immediately after transfer of the user program is completed). Consequently, after the branch to the RAM area, NMI input is enabled except during programming and erasing. Interrupt requests must therefore be disabled inside and outside the MCU until the user program has completed initial programming (including the vector table and the NMI interrupt handling routine).
 2. The vector may not be read correctly in this case for the following two reasons:
 - If flash memory is read while being programmed or erased (while the P bit or E bit is set in FLMCR1), correct read data will not be obtained (undetermined values will be returned).
 - If the entry in the interrupt vector table has not been programmed yet, interrupt exception handling will not be executed correctly.

18.10 Flash Memory PROM Mode

The H8/3064F-ZTAT B-mask version have a PROM mode as well as the on-board programming modes for programming and erasing flash memory. In PROM mode, the on-chip ROM can be freely programmed using a general-purpose PROM writer that supports the Renesas microcomputer device type with 256-kbyte on-chip flash memory.

18.10.1 Socket Adapters and Memory Map

In PROM mode using a PROM writer, memory reading (verification) and writing and flash memory initialization (total erasure) can be performed. For these operations, a special socket adapter is mounted in the PROM writer. The socket adapter product codes are given in table 18.11. In the H8/3064F-ZTAT B-mask version PROM mode, only the socket adapters shown in this table should be used.

Table 18.11 H8/3064F-ZTAT B-Mask Version Socket Adapter Product Codes

Product Code	Package	Socket Adapter Product Code	Manufacturer
HD64F3064BF	100-pin QFP (FP-100B)	ME3064ESHF1H	MINATO ELECTRONICS INC.
HD64F3064BTE	100-pin TQFP (TFP-100B)	ME3064ESNF1H	
HD64F3064BFP	100-pin QFP (FP-100A)	ME3064ESFF1H	
HD64F3064BF	100-pin QFP (FP-100B)	HF306BQ100D4001	DATA I/O JAPAN CO.
HD64F3064BTE	100-pin TQFP (TFP-100B)	HF306BT100D4001	
HD64F3064BFP	100-pin QFP (FP-100A)	HF306AQ100D4001	

Figure 18.15 shows the memory map in PROM mode.

Figure 18.15 Memory Map in PROM Mode

18.10.2 Notes on Use of PROM Mode

1. A write to a 128-byte programming unit in PROM mode should be performed once only. Erasing must be carried out before reprogramming an address that has already been programmed.
2. When using a PROM writer to reprogram a device on which on-board programming/erasing has been performed, it is recommended that erasing be carried out before executing programming.
3. The memory is initially in the erased state when the device is shipped by Renesas. For samples for which the erasure history is unknown, it is recommended that erasing be executed to check and correct the initialization (erase) level.
4. The H8/3064F-ZTAT B-mask version does not support a product identification mode as used with general-purpose EPROMs, and therefore the device name cannot be set automatically in the PROM writer.
5. Refer to the instruction manual provided with the socket adapter, or other relevant documentation, for information on PROM writers and associated program versions that are compatible with the PROM mode of the H8/3064F-ZTAT B-mask version.

18.11 Flash Memory Programming and Erasing Precautions

Precautions concerning the use of on-board programming mode, the RAM emulation function, and PROM mode are summarized below.

1. Use the specified voltages and timing for programming and erasing.

Applied voltages in excess of the rating can permanently damage the device. Use a PROM programmer that supports the Renesas microcomputer device type with 256-kbyte on-chip flash memory.

2. Powering on and off (See figures 18.16 to 18.18)

Do not apply a high level to the FWE pin until V_{CC} has stabilized. Also, drive the FWE pin low before turning off V_{CC} .

When applying or disconnecting V_{CC} power, fix the FWE pin low and place the flash memory in the hardware protection state.

The power-on and power-off timing requirements should also be satisfied in the event of a power failure and subsequent recovery. Failure to do so may result in overprogramming or overerasing due to MCU runaway, and loss of normal memory cell operation.

3. FWE application/disconnection

FWE application should be carried out when MCU operation is in a stable condition. If MCU operation is not stable, fix the FWE pin low and set the protection state.

The following points must be observed concerning FWE application and disconnection to prevent unintentional programming or erasing of flash memory:

- Apply FWE when the V_{CC} voltage has stabilized within its rated voltage range.
If FWE is applied when the MCU's V_{CC} power supply is not within its rated voltage range, MCU operation will be unstable and flash memory may be erroneously programmed or erased.

- Apply FWE when oscillation has stabilized (after the elapse of the oscillation settling time).

When V_{CC} power is turned on, hold the \overline{RES} pin low for the duration of the oscillation settling time before applying FWE. Do not apply FWE when oscillation has stopped or is unstable.

- In boot mode, apply and disconnect FWE during a reset.

In a transition to boot mode, FWE = 1 input and MD₂ to MD₀ setting should be performed while the \overline{RES} input is low. FWE and MD₂ to MD₀ pin input must satisfy the mode programming setup time (t_{MDS}) with respect to the reset release timing. When making a transition from boot mode to another mode, also, a mode programming setup time is necessary with respect to the reset release timing.

In a reset during operation, the \overline{RES} pin must be held low for a minimum of 20 system clock cycles.

- In user program mode, FWE can be switched between high and low level regardless of \overline{RES} input.

FWE input can also be switched during execution of a program in flash memory.

- Do not apply FWE if program runaway has occurred.

During FWE application, the program execution state must be monitored using the watchdog timer or some other means.

- Disconnect FWE only when the SWE, ESU, PSU, EV, PV, E, and P bits in FLMCR1 are cleared.

Make sure that the SWE, ESU, PSU, EV, PV, E, and P bits are not set by mistake when applying or disconnecting FWE.

4. Do not apply a constant high level to the FWE pin.

To prevent erroneous programming or erasing due to program runaway, etc., apply a high level to the FWE pin only when programming or erasing flash memory (including execution of flash memory emulation using RAM). A system configuration in which a high level is constantly

applied to the FWE pin should be avoided. Also, while a high level is applied to the FWE pin, the watchdog timer should be activated to prevent overprogramming or overerasing due to program runaway, etc.

5. Use the recommended algorithm when programming and erasing flash memory.

The recommended algorithm enables programming and erasing to be carried out without subjecting the device to voltage stress or sacrificing program data reliability. When setting the PSU or ESU bit in FLMCR1, the watchdog timer should be set beforehand as a precaution against program runaway, etc.

Also note that access to the flash memory space by means of a MOV instruction, etc., is not permitted while the P bit or E bit is set.

6. Do not set or clear the SWE bit during execution of a program in flash memory.

Clear the SWE bit before executing a program or reading data in flash memory. When the SWE bit is set, data in flash memory can be rewritten, but flash memory should only be accessed for verify operations (verification during programming/erasing).

Similarly, when using the RAM emulation function while a high level is being input to the FWE pin, the SWE bit must be cleared before executing a program or reading data in flash memory. However, the RAM area overlapping flash memory space can be read and written to regardless of whether the SWE bit is set or cleared.

A wait time is necessary after the SWE bit is cleared. For details see table 22.30 in section 22.3.6, Flash Memory Characteristics.

7. Do not use interrupts while flash memory is being programmed or erased.

All interrupt requests, including NMI, should be disabled during FWE application to give priority to program/erase operations (including emulation in RAM).

Bus release must also be disabled.

8. Do not perform additional programming. Erase the memory before reprogramming.

In on-board programming, perform only one programming operation on a 128-byte programming unit block. Programming should be carried out with the entire programming unit block erased.

9. Before programming, check that the chip is correctly mounted in the PROM writer.

Overcurrent damage to the device can result if the index marks on the PROM writer socket, socket adapter, and chip are not correctly aligned.

10. Do not touch the socket adapter or chip during programming.

Touching either of these can cause contact faults and write errors.

11. A wait time of 100 μ s or more is necessary when performing a read after a transition to normal mode from program, erase, or verify mode.

12. Use byte access on the registers that control the flash memory (FLMCR1, FLMCR2, EBR1, EBR2, and RAMCR).

18.12 Masked ROM (H8/3064 Masked ROM B-Mask Version) Overview

18.12.1 Block Diagram

Figure 18.19 shows a block diagram of the ROM.

Figure 18.19 ROM Block Diagram (H8/3064 Masked ROM B-Mask Version)

18.13 Notes on Ordering Masked ROM Version Chips

When ordering H8/3064 with masked ROM, note the following.

1. When ordering by means of an EPROM, use a 512-kbyte one.
2. Fill all unused addresses with H'FF as shown in figure 18.20 to make the ROM data size 512-kbytes for the H8/3064 masked ROM version. This applies to ordering by means of an EPROM and by means of data transmission.

Figure 18.20 Masked ROM Addresses and Data

3. The flash memory control registers (FLMCR, EBR, RAMCR, FLMSR, FLMCR1, FLMCR2, EBR1, and EBR2) used by the versions with on-chip flash memory are not provided in the masked ROM version. Reading the corresponding addresses in a masked ROM version will always return 1s, and writes to these addresses are disabled. This must be borne in mind when switching from a flash memory version to a masked ROM version.

18.14 Notes when Converting the F-ZTAT Application Software to the Masked ROM Version

Please note the following when converting the F-ZTAT application software to the masked ROM version.

The values read from the internal registers for the flash ROM in the masked ROM version and F-ZTAT version differ as follows.

Register	Bit	Value	Status	
			F-ZTAT Version	Masked ROM Version
FLMCR1	FWE	0	Application software running	— (Is not read out)
		1	Programming	Application software running (This bit is always read as 1)

Note: This difference applies to all the F-ZTAT versions and all the masked ROM versions that have different ROM size.

Section 19 H8/3062 Internal Voltage Step-Down Version ROM

[H8/3062F-ZTAT B-Mask Version, Masked ROM B-Mask Versions
of H8/3062, H8/3061, and H8/3060]

19.1 Overview

The H8/3062F-ZTAT B-mask version has 128 kbytes of on-chip flash memory. The masked ROM B-mask versions of H8/3062, H8/3061, H8/3060 have 128 kbytes, 96 kbytes, 64 kbytes of on-chip masked ROM, respectively. The flash memory is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, enabling rapid data transfer.

The on-chip ROM is enabled and disabled by setting the mode pins (MD₂ to MD₀) as shown in table 19.1.

The on-chip flash memory product (H8/3062F-ZTAT B-mask version) can be erased and programmed on-board, as well as with a special-purpose PROM programmer.

Table 19.1 Operating Modes and ROM

Mode	Mode Pins			On-Chip ROM
	MD2	MD1	MD0	
Mode 1 (expanded 1-Mbyte mode with on-chip ROM disabled)	0	0	1	Disabled (external address area)
Mode 2 (expanded 1-Mbyte mode with on-chip ROM disabled)	0	1	0	
Mode 3 (expanded 16-Mbyte mode with on-chip ROM disabled)	0	1	1	
Mode 4 (expanded 16-Mbyte mode with on-chip ROM disabled)	1	0	0	
Mode 5 (expanded 16-Mbyte mode with on-chip ROM enabled)	1	0	1	Enabled
Mode 6 (single-chip normal mode)	1	1	0	
Mode 7 (single-chip advanced mode)	1	1	1	

19.1.1 Differences from H8/3062F-ZTAT R-Mask Version and H8/3062F-ZTAT B-Mask Version

- Notes: 1. See section 19.6, Flash Memory Programming/Erasing, for details of the H8/3062F-ZTAT B-mask version program/erase algorithms.
2. See section 22.5.6, Flash Memory Characteristics, for details of the H8/3062F-ZTAT B-mask version flash memory characteristics.

19.2 Features

The H8/3062F-ZTAT B-mask version has 128 kbytes of on-chip flash memory.

The features of the flash memory are summarized below.

- Four flash memory operating modes
 - Program mode
 - Erase mode
 - Program-verify mode
 - Erase-verify mode
- Programming/erase methods

The flash memory is programmed 128 bytes at a time. Erasing is performed in block units. To erase the entire flash memory, each block must be erased in turn. In block erasing, 1-kbyte, 28-kbyte, and 32-kbyte blocks can be set arbitrarily.
- Programming/erase times

The flash memory programming time is 10 ms (typ) for simultaneous 128-byte programming, equivalent approximately to 80 μ s (typ) per byte, and the erase time is 100 ms (typ) per block.
- Reprogramming capability

The flash memory can be reprogrammed up to 100 times.
- On-board programming modes

There are two modes in which flash memory can be programmed/erased/verified on-board. A function is also provided specially in boot mode for identifying a program transferred from the host side.:

 - Boot mode
 - User program mode
- Automatic bit rate adjustment

For data transfer in boot mode, the H8/3062F-ZTAT B-mask version chip's bit rate can be automatically adjusted to match the transfer bit rate of the host.
- Flash memory emulation in RAM

Flash memory programming can be emulated in real time by overlapping a part of RAM onto flash memory.
- Protect modes

There are three protect modes—hardware, software, and error—which allow protected status to be designated for flash memory program/erase/verify operations.

- PROM mode

Flash memory can be programmed/erased in PROM mode, using a PROM programmer, as well as in on-board programming mode.

19.2.1 Block Diagram

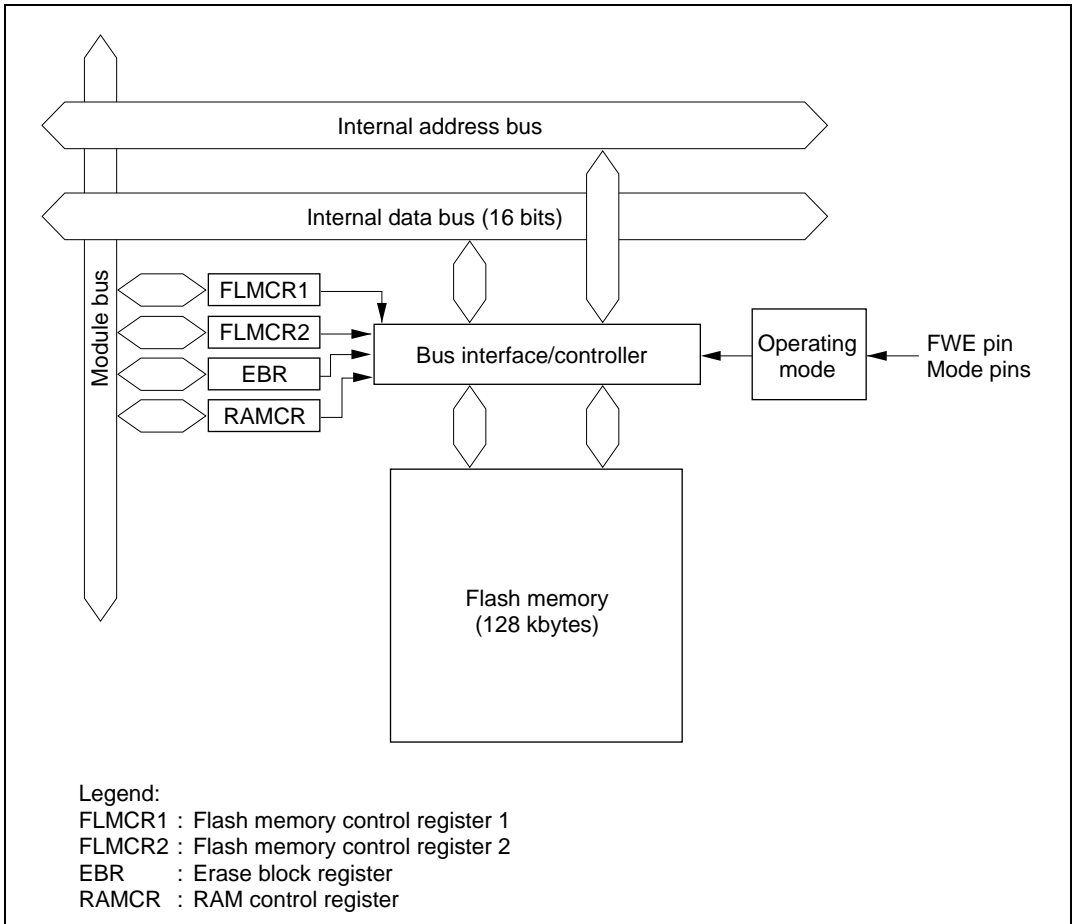

Figure 19.1 Block Diagram of Flash Memory

19.2.2 Pin Configuration

The flash memory is controlled by means of the pins shown in table 19.3.

Table 19.3 Flash Memory Pins

Pin Name	Abbreviation	I/O	Function
Reset	$\overline{\text{RES}}$	Input	Reset
Flash write enable	FWE	Input	Flash program/erase protection by hardware
Mode 2	MD ₂	Input	Sets H8/3062F-ZTAT B-mask version operating mode
Mode 1	MD ₁	Input	Sets H8/3062F-ZTAT B-mask version operating mode
Mode 0	MD ₀	Input	Sets H8/3062F-ZTAT B-mask version operating mode
Transmit data	TxD ₁	Output	Serial transmit data output
Receive data	RxD ₁	Input	Serial receive data input

19.2.3 Register Configuration

The registers used to control the on-chip flash memory when enabled are shown in table 19.4.

Table 19.4 Flash Memory Registers

Register Name	Abbreviation	R/W	Initial Value	Address* ¹
Flash memory control register 1	FLMCR1	R/W	H'00* ²	H'EE030
Flash memory control register 2	FLMCR2	R	H'00	H'EE031
Erase block register	EBR	R/W	H'00	H'EE032
RAM control register	RAMCR	R/W	H'F1	H'EE077

Notes: FLMCR1, FLMCR2, EBR, and RAMCR are 8-bit registers, and should be accessed by byte access. These registers are used only in the versions with on-chip flash memory, and are not provided in the versions with on-chip masked ROM. Reading the corresponding addresses in a masked ROM version will always return 1s, and writes to these addresses are invalid.

1. Lower 20 bits of address in advanced mode
2. When a high level is input to the FWE pin, the initial value is H'80.

19.3 Register Descriptions

19.3.1 Flash Memory Control Register 1 (FLMCR1)

Bit	7	6	5	4	3	2	1	0
	FWE	SWE	ESU	PSU	EV	PV	E	P
Initial value	—*	0	0	0	0	0	0	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: * Determined by the state of the FWE pin.

FLMCR1 is an 8-bit register used for flash memory operating mode control.

Program-verify mode or erase-verify mode for addresses H'00000 to H'1FFFF is entered by setting the SWE bit when FWE = 1, then setting the PV or EV bit. Program mode for addresses H'00000 to H'1FFFF is entered by setting the SWE bit when FWE = 1, then setting the PSU bit, and finally setting the P bit. Erase mode for addresses H'00000 to H'1FFFF is entered by setting the SWE bit when FWE = 1, then setting the ESU bit, and finally setting the E bit. FLMCR1 is initialized by a reset, and in hardware standby mode and software standby mode. Its initial value is H'80 when a high level is input to the FWE pin, and H'00 when a low level is input. In mode 6 the FWE pin must be fixed low since flash memory on-board programming modes are not supported. When the on-chip flash memory is disabled, a read access to this register will return H'00, and writes are invalid.

When setting bits 6 to 0 in this register, one bit must be set one at a time. Writes to the SWE bit in FLMCR1 are enabled only when FWE = 1; writes to bits ESU, PSU, EV, and PV only when FWE = 1 and SWE = 1; writes to the E bit only when FWE = 1, SWE = 1, and ESU = 1; and writes to the P bit only when FWE = 1, SWE = 1, and PSU = 1.

- Notes:
1. The programming and erase flowcharts must be followed when setting the bits in this register to prevent erroneous programming or erasing.
 2. Transitions are made to program mode, erase mode, program-verify mode, and erase-verify mode according to the settings in this register. When reading flash memory as normal on-chip ROM, bits 6 to 0 in this register must be cleared.

Bit 7—Flash Write Enable (FWE): Sets hardware protection against flash memory programming/erasing.

Bit 7

FWE	Description
0	When a low level is input to the FWE pin (hardware-protected state)
1	When a high level is input to the FWE pin

Bit 6—Software Write Enable (SWE): Enables or disables flash memory programming and erasing (This bit should be set when setting bits 5 to 0 and EBR bits 7 to 0).

Bit 6

SWE	Description
0	Programming/erasing disabled (Initial value)
1	Programming/erasing enabled [Setting condition] When FWE = 1

Note: Do not execute a SLEEP instruction while the SWE bit is set to 1.

Bit 5—Erase Setup (ESU): Prepares for a transition to erase mode. Set this bit to 1 before setting the E bit to 1 in FLMCR1 (Do not set the SWE, PSU, EV, PV, E, or P bit at the same time).

Bit 5

ESU	Description
0	Erase setup cleared (Initial value)
1	Erase setup [Setting condition] When FWE = 1 and SWE = 1

Bit 4—Program Setup (PSU): Prepares for a transition to program mode. Set this bit to 1 before setting the P bit to 1 in FLMCR1 (Do not set the SWE, ESU, EV, PV, E, or P bit at the same time).

Bit 4 PSU	Description	
0	Program setup cleared	(Initial value)
1	Program setup [Setting condition] When FWE = 1 and SWE = 1	

Bit 3—Erase-Verify Mode (EV): Selects erase-verify mode transition or clearing (Do not set the SWE, ESU, PSU, PV, E, or P bit at the same time).

Bit 3 EV	Description	
0	Erase-verify mode cleared	(Initial value)
1	Transition to erase-verify mode [Setting condition] When FWE = 1 and SWE = 1	

Bit 2—Program-Verify Mode (PV): Selects program-verify mode transition or clearing (Do not set the SWE, ESU, PSU, EV, E, or P bit at the same time).

Bit 2 PV	Description	
0	Program-verify mode cleared	(Initial value)
1	Transition to program-verify mode [Setting condition] When FWE = 1 and SWE = 1	

Bit 1—Erase Mode (E): Selects erase mode transition or clearing (Do not set the SWE, ESU, PSU, EV, PV, or P bit at the same time).

Bit 1

E	Description	
0	Erase mode cleared	(Initial value)
1	Transition to erase mode [Setting condition] When FWE = 1, SWE = 1, and ESU = 1	

Note: Do not access the flash memory while the E bit is set.

Bit 0—Program (P): Selects program mode transition or clearing (Do not set the SWE, ESU, PSU, EV, PV, or E bit at the same time).

Bit 0

P	Description	
0	Program mode cleared	(Initial value)
1	Transition to program mode [Setting condition] When FWE = 1, SWE = 1, and PSU = 1	

Note: Do not access the flash memory while the P bit is set.

19.3.2 Flash Memory Control Register 2 (FLMCR2)

Bit	7	6	5	4	3	2	1	0
	FLER	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

FLMCR2 is an 8-bit register used for flash memory operating mode control. FLMCR2 is initialized to H'00 by a reset, and in hardware standby mode and software standby mode. When the on-chip flash memory is disabled, a read will return H'00.

Note: FLMCR2 is a read-only register, and should not be written to.

Bit 7—Flash Memory Error (FLER): Indicates that an error has occurred during an operation on flash memory (programming or erasing). When FLER is set to 1, flash memory goes to the error-protection state.

Bit 7

FLER	Description
0	Flash memory is operating normally Flash memory program/erase protection (error protection) is disabled [Clearing condition] Reset ($\overline{\text{RES}}$ pin or WDT reset) or hardware standby mode (Initial value)
1	An error occurred during flash memory programming/erasing Flash memory program/erase protection (error protection) is enabled [Setting conditions] <ul style="list-style-type: none"> • When flash memory is read during programming/erasing (including a vector read or instruction fetch, but excluding a read of the RAM area overlapping flash memory space) • Immediately after the start of exception handling during programming/erasing (excluding reset, illegal instruction, trap instruction, and division-by-zero exception handling) • When a SLEEP instruction (including software standby) is executed during programming/erasing • When the bus is released during programming/erasing

Bits 6 to 0—Reserved: These bits are always read as 0.

19.3.3 Erase Block Register (EBR)

EBR is an 8-bit register that designates the flash memory block for erasure. EBR is initialized to H'00 by a reset, in hardware standby mode or software standby mode, when a high level is not input to the FWE pin, or when the SWE bit in FLMCR1 is 0 when a high level is applied to the FWE pin. When a bit is set in EBR, the corresponding block can be erased. Other blocks are erase-protected. The blocks are erased block by block. Therefore, set only one bit in EBR; do not set bits in EBR to erase two or more blocks at the same time.

Each bit in EBR cannot be set until the SWE bit in FLMCR1 is set. The flash memory block configuration is shown in table 19.5. To erase all the blocks, erase each block sequentially.

The H8/3062F-ZTAT B-mask version does not support the on-board programming mode in mode 6, so bits in this register cannot be set to 1 in mode 6.

Bit		7	6	5	4	3	2	1	0
		EB7	EB6	EB5	EB4	EB3	EB2	EB1	EB0
Modes 1 to 4, and 6	Initial value	0	0	0	0	0	0	0	0
	Read/Write	R	R	R	R	R	R	R	R
Modes 5 and 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 7 to 0—Block 7 to Block 0 (EB7 to EB0): Setting one of these bits specifies the corresponding block (EB7 to EB0) for erasure.

Bits 7–0

EB7–EB0	Description
0	Corresponding block (EB7 to EB0) not selected (Initial value)
1	Corresponding block (EB7 to EB0) selected

Note: When not performing an erase, clear all EBR bits to 0.

Table 19.5 Flash Memory Erase Blocks

Block (Size)	Address
EB0 (1 kbyte)	H'000000 to H'0003FF
EB1 (1 kbyte)	H'000400 to H'0007FF
EB2 (1 kbyte)	H'000800 to H'000BFF
EB3 (1 kbyte)	H'000C00 to H'000FFF
EB4 (28 kbytes)	H'001000 to H'007FFF
EB5 (32 kbytes)	H'008000 to H'00FFFF
EB6 (32 kbytes)	H'010000 to H'017FFF
EB7 (32 kbytes)	H'018000 to H'01FFFF

19.3.4 RAM Control Register (RAMCR)

RAMCR selects the RAM area to be used when emulating real-time flash memory programming.

Bit	7	6	5	4	3	2	1	0	
	—	—	—	—	RAMS	RAM2	RAM1	—	
Modes 1 to 4 {	Initial value	1	1	1	1	0	0	0	1
1 to 4 {	Read/Write	—	—	—	—	R	R	R	—
Modes 5 to 7 {	Initial value	1	1	1	1	0	0	0	1
5 to 7 {	Read/Write	—	—	—	—	R/W*	R/W*	R/W*	—

Reserved bits
RAM2, RAM1
Used together with bit 3 to select
a flash memory area
Reserved bit

RAM select
 Used together with bits 2 and 1 to select
 a flash memory area

Note: * Cannot be set to 1 in mode 6.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bit 3—RAM Select (RAMS): Used with bits 2 to 1 to reassign an area to RAM (see table 19.6). The initial setting for this bit is 0 in modes 5, 6, and 7 (internal flash memory enabled) and programming is enabled*. In modes other than 5 to 7, 0 is always read and writing is disabled. This bit is initialized by a reset and in hardware standby mode. It is not initialized in software standby mode.

When 1 is written to the RAMS bit, all flash memory blocks are protected from programming and erasing.

Bits 2 and 1—RAM2 and RAM1: These bits are used with bit 3 to reassign an area to RAM (See table 19.6). The initial setting for this bit is 0 in modes 5, 6, and 7 (internal flash memory enabled) and programming is enabled*. In modes other than 5 to 7, 0 is always read and writing is disabled. These bits are initialized by a reset and in hardware standby mode. They are not initialized in software standby mode.

Bit 0—Reserved: This bit cannot be modified and is always read as 1.

Note: * Flash memory emulation by RAM is not supported for mode 6 (single chip normal mode), so programming is possible, but do not set 1.

When performing flash memory emulation by RAM, the RAME bit in SYSCR must be set to 1.

Table 19.6 RAM Area Setting

RAM Area	Bit 3	Bit 2	Bit 1	RAM Emulation Status
	RAMS	RAM2	RAM1	
H'FFF000 to H'FFF3FF	0	0/1	0/1	No emulation
H'000000 to H'0003FF	1	0	0	Mapping RAM
H'000400 to H'0007FF	1	0	1	
H'000800 to H'000BFF	1	1	0	
H'000C00 to H'000FFF	1	1	1	

Figure 19.2 Example of ROM Area/RAM Area Overlap

19.4 Overview of Operation

19.4.1 Mode Transitions

When the mode pins and the FWE pin are set in the reset state and a reset-start is executed, the H8/3062F-ZTAT B-mask version enters one of the operating modes shown in figure 19.3. In user mode, flash memory can be read but not programmed or erased.

Flash memory can be programmed and erased in boot mode, user program mode, and PROM mode.

Boot mode and user program mode cannot be used in the H8/3062F-ZTAT B-mask version's mode 6 (normal mode with on-chip ROM enabled).

Figure 19.3 Flash Memory Related State Transitions

State transitions between the normal and user modes and on-board programming mode are performed by changing the FWE pin level from high to low or from low to high. To prevent misoperation (erroneous programming or erasing) in these cases, the bits in the flash memory control register (FLMCR1) should be cleared to 0 before making such a transition. After the bits are cleared, a wait time is necessary. Normal operation is not guaranteed if this wait time is insufficient.

19.4.2 On-Board Programming Modes

Example of Boot Mode Operation

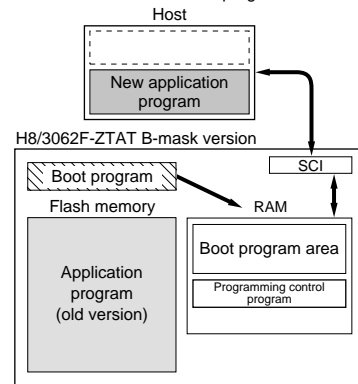

1. Initial state

The old program version or data remains written in the flash memory. The user should prepare the programming control program and new application program beforehand in the host.

2. Programming control program transfer

When boot mode is entered, the boot program in the H8/3062F-ZTAT B-mask version (originally incorporated in the chip) is started and the programming control program in the host is transferred to RAM via SCI communication. The boot program required for flash memory erasing is automatically transferred to the RAM boot program area.

3. Flash memory initialization

The erase program in the boot program area (in RAM) is executed, and the flash memory is initialized (to H'FF). In boot mode, total flash memory erasure is performed, without regard

4. Writing new application program

An identification check is carried out to see if the programming control program is compatible with the H8/3062F-ZTAT B-mask version. The programming control program transferred from the host to RAM is executed, and the new application program in the host is written into the flash memory.

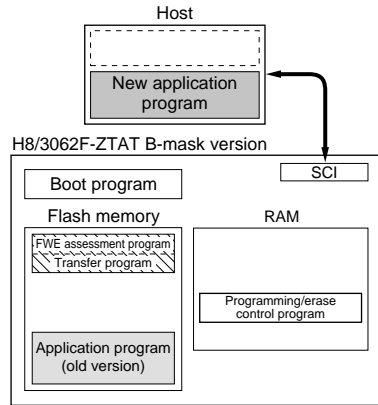

Program execution state

Example of User Program Mode Operation

1. Initial state
The FWE assessment program that confirms that user program mode has been entered, and the program that will transfer the programming/erase control program from flash memory to on-chip RAM should be written into the flash memory by the user beforehand. The programming/erase control program should be prepared in the host or in the flash memory.

2. Programming/erase control program transfer
When user program mode is entered, user software recognizes this fact, executes the transfer program in the flash memory, and transfers the programming/erase control program to RAM.

3. Flash memory initialization
The programming/erase program in RAM is executed, and the flash memory is initialized (to H'FF). Erasing can be performed in block units, but not in byte units.

4. Writing new application program
Next, the new application program in the host is written into the erased flash memory blocks. Do not write to unerased blocks.

 Program execution state

19.4.3 Flash Memory Emulation in RAM

In the H8/3062F-ZTAT B-mask version, flash memory programming can be emulated in real time by overlapping the flash memory with part of RAM (“overlap RAM”). When the emulation block set in RAMCR is accessed while the emulation function is being executed, data written in the overlap RAM is read.

Emulation should be performed in user mode or user program mode.

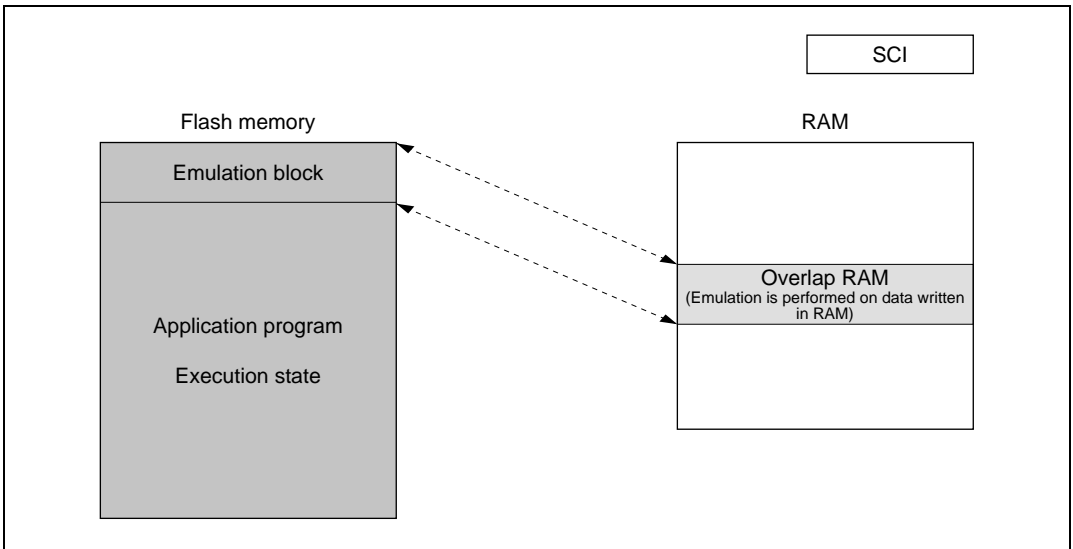

Figure 19.4 Reading Overlap RAM Data in User Mode/User Program Mode

When overlap RAM data is confirmed, clear the RAMS bit to cancel RAM overlap, and actually perform writes to the flash memory in user program mode.

When the programming control program is transferred to RAM in on-board programming mode, ensure that the transfer destination and the overlap RAM do not overlap, as this will cause data in the overlap RAM to be rewritten.

Figure 19.5 Writing Overlap RAM Data in User Program Mode

19.4.4 Block Configuration

The flash memory in the H8/3062F-ZTAT B-mask version is divided into three 32-kbyte blocks, one 28-kbyte block, and four 1-kbyte blocks. Erasing can be carried out in block units.

19.5 On-Board Programming Mode

When pins are set to on-board programming mode and a reset-start is executed, the chip enters the on-board programming state in which on-chip flash memory programming, erasing, and verifying can be carried out. There are two operating modes in this mode—boot mode and user program mode. The pin settings for entering each mode are shown in table 19.7. For a diagram of the transitions to the various flash memory modes, see figure 19.3.

Boot mode and user program mode cannot be used in the H8/3062F-ZTAT B-mask version's mode 6 (on-chip ROM enabled).

Table 19.7 On-Board Programming Mode Settings

Mode		FWE	MD ₂	MD ₁	MD ₀
Boot mode	Mode 5	1* ¹	0* ²	0	1
	Mode 7		0* ²	1	1
User program mode	Mode 5		1	0	1
	Mode 7		1	1	1

Notes: 1. For the High level input timing, see items 6 and 7 of "Notes on Using the Boot Mode" in section 18.5.1.

2. In boot mode, the MD₂ setting should be the inverse of the input.

In the boot mode in the H8/3062F-ZTAT B-mask version, the levels of the mode pins (MD₂ to MD₀) are reflected in mode select bits 2 to 0 (MDS2 to MDS0) in the mode control register (MDCR).

19.5.1 Boot Mode

When boot mode is used, a flash memory programming control program must be prepared beforehand in the host, and SCI channel 1, which is to be used, must be set to asynchronous mode.

When a reset-start is executed after setting the H8/3062F-ZTAT B-mask version' pins to boot mode, the boot program already incorporated in the MCU is activated, and the programming control program prepared beforehand in the host is transmitted sequentially to the H8/3062F-ZTAT B-mask version, using the SCI. In the H8/3062F-ZTAT B-mask version, the programming control program received via the SCI is written into the programming control program area in on-chip RAM. After the transfer is completed, an identification check (ID code check) is carried out to see if the programming control program is compatible with the H8/3062F-ZTAT B-mask version. If the ID code matches, control branches to the start address (H'FFF520) of the programming control program area and the programming control program execution state is entered (flash memory programming/erasing can be performed).

Figure 19.6 shows a system configuration diagram when using boot mode, and figure 19.7 shows the boot program mode execution procedure.

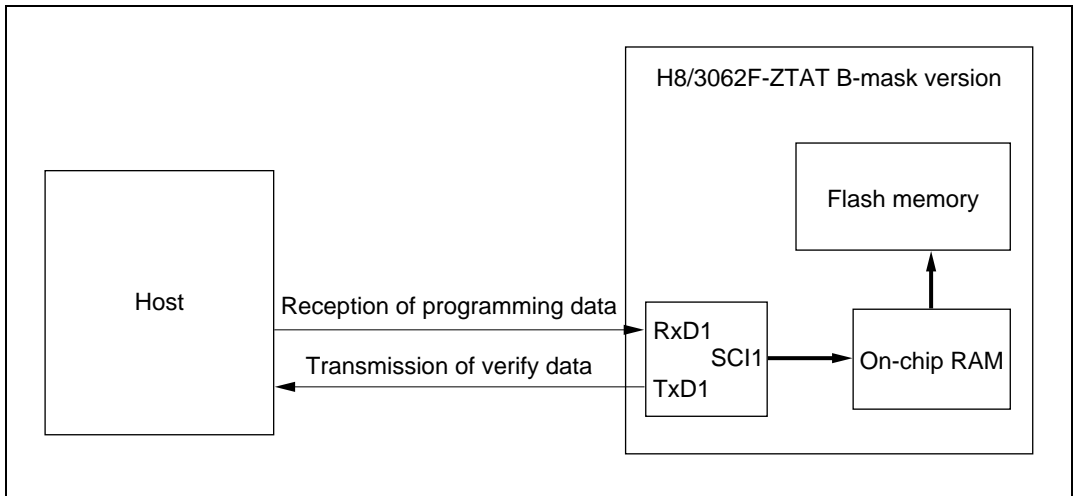

Figure 19.6 System Configuration When Using Boot Mode

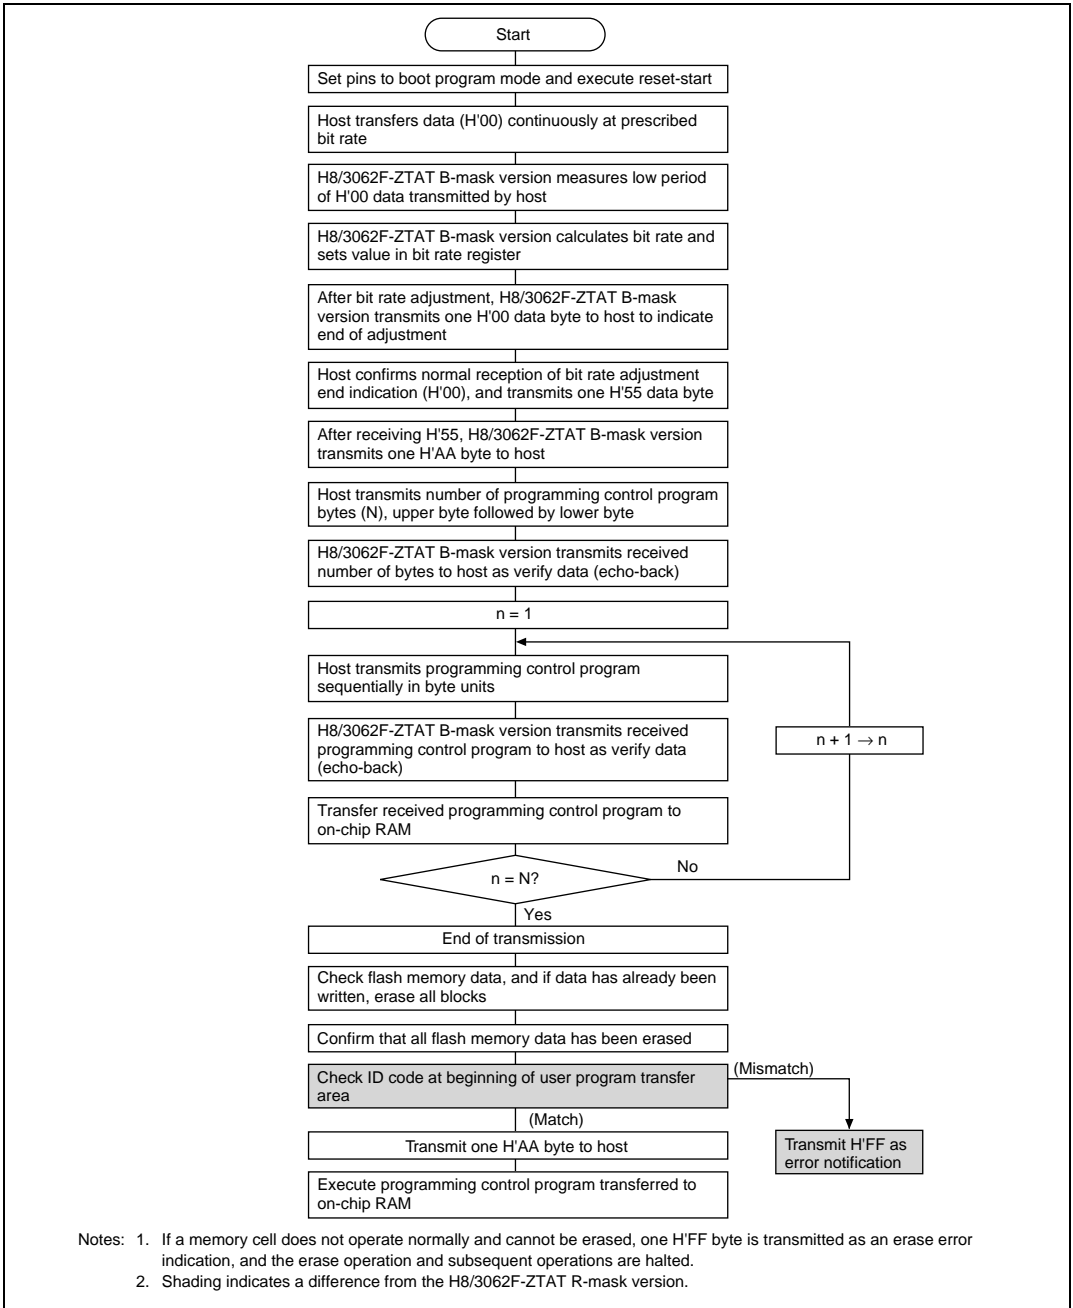

Figure 19.7 Boot Mode Execution Procedure

Automatic SCI Bit Rate Adjustment:

When boot mode is initiated, the H8/3062F-ZTAT B-mask version measures the low period of the asynchronous SCI communication data (H'00) transmitted continuously from the host. The SCI transmit/receive format should be set as 8-bit data, 1 stop bit, no parity. The H8/3062F-ZTAT B-mask version calculates the bit rate of the transmission from the host from the measured low period, and transmits one H'00 byte to the host to indicate the end of bit rate adjustment. The host should confirm that this adjustment end indication (H'00) has been received normally, and transmit one H'55 byte to the H8/3062F-ZTAT B-mask version. If reception cannot be performed normally, initiate boot mode again (reset), and repeat the above operations. Depending on the host's transmission bit rate and the H8/3062F-ZTAT B-mask version's system clock frequency, there will be a discrepancy between the bit rates of the host and the H8/3062F-ZTAT B-mask version. To ensure correct SCI operation, the host's transfer bit rate should be set to 4800, 9600, or 19,200 bps*.

Table 19.8 shows typical host transfer bit rates and system clock frequencies for which automatic adjustment of the H8/3062F-ZTAT B-mask version bit rate is possible. The boot program should be executed within this system clock range.

Table 19.8 System Clock Frequencies for which Automatic Adjustment of H8/3062F-ZTAT B-Mask Version Bit Rate is Possible

Host Bit Rate (bps)	System Clock Frequency for which Automatic Adjustment of H8/3062F-ZTAT B-Mask Version Bit Rate is Possible (MHz)
19,200	16 to 25
9,600	8 to 25
4,800	4 to 25

Note: * Only use a setting of 4800, 9600, or 19200 for the host's bit rate. No other settings can be used.

Although the H8/3062F-ZTAT B-mask version may also perform automatic bit rate adjustment with bit rate and system clock combinations other than those shown in table

19.8, a degree of error will arise between the bit rates of the host and the MCU, and subsequent transfer will not be performed normally. Therefore, only a combination of bit rate and system clock frequency within one of the ranges shown in table 19.8 can be used for boot mode execution.

On-Chip RAM Area Divisions in Boot Mode: In boot mode, the RAM area is divided into an area used by the boot program and an area to which the user program is transferred via the SCI, as shown in figure 19.8. The boot program area becomes available when a transition is made to the execution state for the user program transferred to RAM.

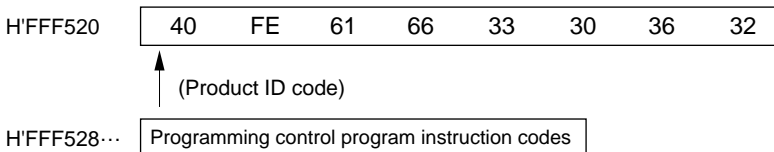

Figure 19.8 RAM Areas in Boot Mode

In boot mode in the H8/3062F-ZTAT B-mask version, the contents of the 8-byte ID code area shown below are checked to determine whether the program is a programming control program compatible with the H8/3062F-ZTAT B-mask version.

If an original programming control program is used in boot mode, the 8-byte ID code shown above should be added at the beginning of the program.

Notes on Use of Boot Mode:

1. When the H8/3062F-ZTAT B-mask version chip comes out of reset in boot mode, it measures the low period of the input at the SCI's RxD₁ pin. The reset should end with RxD₁ high. After the reset ends, it takes about 100 states for the chip to get ready to measure the low period of the RxD₁ input.
2. In boot mode, if any data has been programmed into the flash memory (if all data is not 1), all flash memory blocks are erased. Boot mode is for use when user program mode is unavailable, such as the first time on-board programming is performed, or if the program activated in user program mode is accidentally erased.
3. Interrupts cannot be used while the flash memory is being programmed or erased.
4. The RxD₁ and TxD₁ lines should be pulled up on the board.
5. Before branching to the user program the H8/3062F-ZTAT B-mask version terminates transmit and receive operations by the on-chip SCI (channel 1) (by clearing the RE and TE bits to 0 in the serial control register (SCR)), but the adjusted bit rate value remains set in the bit rate register (BRR). The transmit data output pin, TxD₁, goes to the high-level output state (P9₁DDR = 1 in P9DDR, P9₁DR = 1 in P9DR).

The contents of the CPU's internal general registers are undefined at this time, so these registers must be initialized immediately after branching to the user program. In particular, since the stack pointer (SP) is used implicitly in subroutine calls, etc., a stack area must be specified for use by the user program.

The initial values of other on-chip registers are not changed.

6. Boot mode can be entered by setting pins MD₀ to MD₂ and FWE in accordance with the mode setting conditions shown in table 19.6, and then executing a reset-start.
 - a. When switching from boot mode to normal mode, the boot mode state within the chip must first be cleared by reset input via the $\overline{\text{RES}}$ pin*¹. The $\overline{\text{RES}}$ pin must be held low for at least 20 system clock cycles*².
 - b. Do not change the input levels of the mode pins (MD₂ to MD₀) or the FWE pin in boot mode. To change the mode, the $\overline{\text{RES}}$ pin must first be driven low to set the reset state. Also, if a watchdog timer reset occurs in the boot mode state, the MCU's internal state will not be cleared, and the on-chip boot program will be restarted regardless of the mode pin states.
 - c. The FWE pin must not be driven low while the boot program is running or flash memory is being programmed or erased*³.
7. If the mode pin input levels are changed (for example, from low to high) during a reset, the state of ports with multiplexed address functions and bus control output signals ($\overline{\text{CSn}}$, $\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{LWR}}$, $\overline{\text{HWR}}$) may also change according to the change in the MCU's operating mode. Therefore, care must be taken to make pin settings to prevent these pins from being used

directly as output signal pins during a reset, or to prevent collision with signals outside the MCU.

- Notes:
1. Mode pin and FWE pin input must satisfy the mode programming setup time (t_{MDS}) with respect to the reset release timing.
 2. See section 4.2.2, Reset Sequence, and section 19.11, Flash Memory Programming and Erasing Precautions. The H8/3062F-ZTAT B-mask version requires a minimum of 20 system clock cycles for a reset during operation.
 3. For further information on FWE application and disconnection, see section 19.11, Flash Memory Programming and Erasing Precautions.

19.5.2 User Program Mode

When set to user program mode, the H8/3062F-ZTAT B-mask version can program and erase its flash memory by executing a user program/erase control program. Therefore, on-board reprogramming of the on-chip flash memory can be carried out by providing on-board means of FWE control and supply of programming data, and storing a program/erase control program in part of the program area as necessary.

To select user program mode, select a mode that enables the on-chip ROM (mode 5 or 7), and apply a high level to the FWE pin. In this mode, on-chip supporting modules other than flash memory operate as they normally would in modes 5 and 7.

Flash memory programming/erasing should not be carried out in mode 6. When mode 6 is set, the FWE pin must be driven low.

The flash memory itself cannot be read while being programmed or erased, so the program that performs programming should be placed in external memory or transferred to RAM and executed there.

Figure 19.9 shows the execution procedure when user program mode is entered during program execution in RAM. It is also possible to start from user program mode in a reset-start.

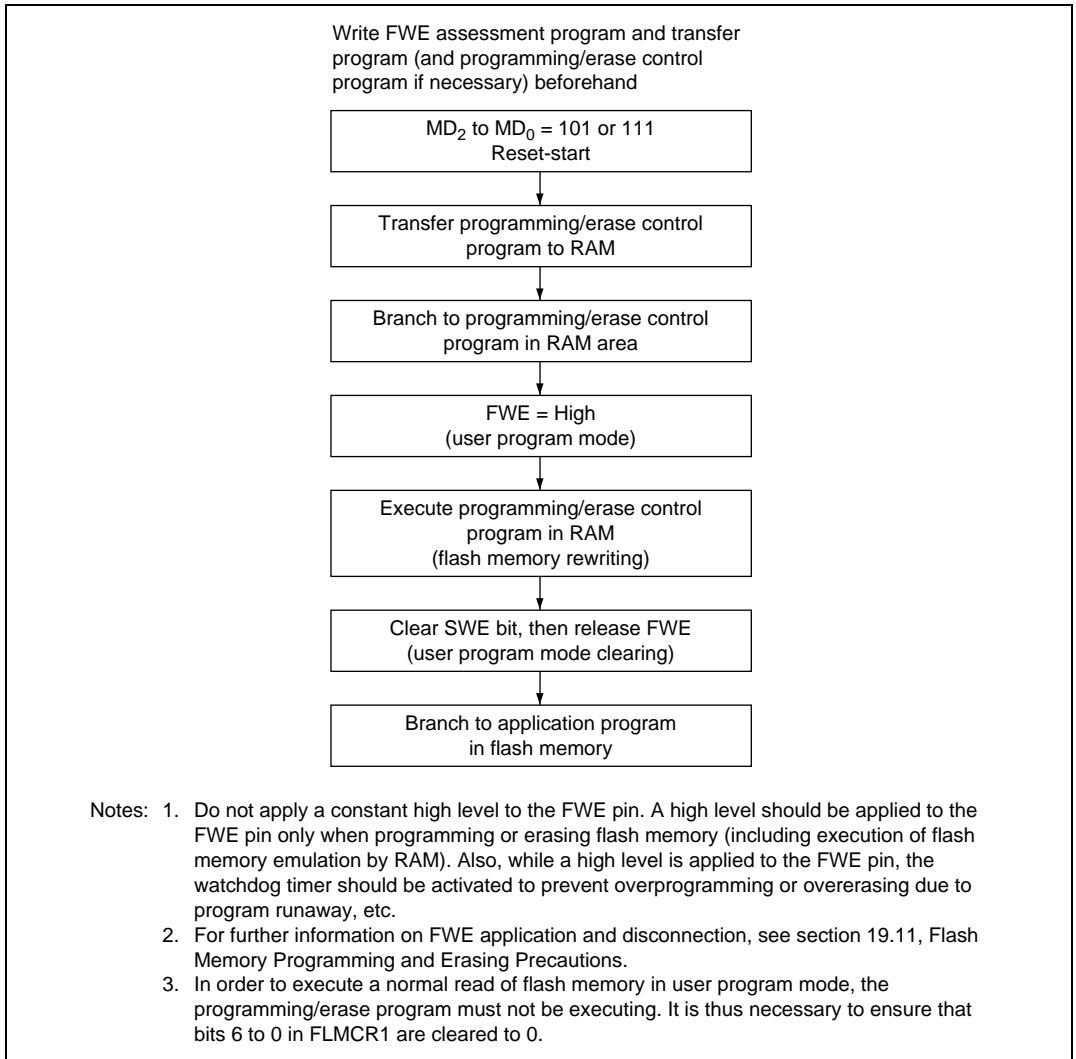

Figure 19.9 Example of User Program Mode Execution Procedure

19.6 Flash Memory Programming/Erasing

A software method, using the CPU, is employed to program and erase flash memory in the on-board programming modes. There are four flash memory operating modes: program mode, erase mode, program-verify mode, and erase-verify mode. Transitions to these modes for addresses H'000000 to H'01FFFF are made by setting the PSU, ESU, P, E, PV, and EV bits in FLMCR1.

The flash memory cannot be read while being programmed or erased. Therefore, the program (user program) that controls flash memory programming/erasing should be located and executed in on-chip RAM or external memory.

See section 19.11, Flash Memory Programming and Erasing Precautions, for points to be noted when programming or erasing the flash memory. In the following operation descriptions, wait times after setting or clearing individual bits in FLMCR1 are given as parameters; for details of the wait times, see section 22.5.6, Flash Memory Characteristics.

- Notes:
1. Operation is not guaranteed if setting/resetting of the SWE, ESU, PSU, EV, PV, E, and P bits in FLMCR1 is executed by a program in flash memory.
 2. When programming or erasing, set FWE to 1 (Programming/erasing will not be executed if FWE = 0).
 3. Programming must be executed in the erased state. Do not perform additional programming on addresses that have already been programmed.

Figure 19.10 FLMCR1 Bit Settings and State Transitions

19.6.1 Program Mode

When writing data or programs to flash memory, the program/program-verify flowchart shown in figure 19.11 should be followed. Performing programming operations according to this flowchart will enable data or programs to be written to flash memory without subjecting the device to voltage stress or sacrificing program data reliability. Programming should be carried out 128 bytes at a time.

The wait times after bits are set or cleared in the flash memory control register 1 (FLMCR1) and the maximum number of programming operations (N) are shown in table 22.40 in section 22.5.6, Flash Memory Characteristics.

Following the elapse of (t_{sswe}) μ s or more after the SWE bit is set to 1 in FLMCR1, 128-byte data is written consecutively to the write addresses. The lower 8 bits of the first address written to must be H'00 and H'80, 128 consecutive byte data transfers are performed. The program address and program data are latched in the flash memory. A 128-byte data transfer must be performed even if writing fewer than 128 bytes; in this case, H'FF data must be written to the extra addresses.

Next, the watchdog timer (WDT) is set to prevent overprogramming due to program runaway, etc. Set a value greater than ($t_{spsu} + t_{sp} + t_{cp} + t_{cpsu}$) μ s as the WDT overflow period. Preparation for entering program mode (program setup) is performed next by setting the PSU bit in FLMCR1. The operating mode is then switched to program mode by setting the P bit in FLMCR1 after the elapse of at least (t_{spsu}) μ s. The time during which the P bit is set is the flash memory programming time. Make a program setting so that the time for one programming operation is within the range of (t_{sp}) μ s.

The wait time after P bit setting must be changed according to the degree of progress through the programming operation. For details see “Notes on Program/Program-Verify Procedure” below.

19.6.2 Program-Verify Mode

In program-verify mode, the data written in program mode is read to check whether it has been correctly written in the flash memory.

After the elapse of the given programming time, clear the P bit in FLMCR1, then wait for at least (t_{cp}) μ s before clearing the PSU bit to exit program mode. After exiting program mode, the watchdog timer setting is also cleared. The operating mode is then switched to program-verify mode by setting the PV bit in FLMCR1. Before reading in program-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (t_{spv}) μ s or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (t_{spvr}) μ s after the dummy write

before performing this read operation. Next, the originally written data is compared with the verify data, and reprogram data is computed (see figure 19.11) and transferred to RAM. After verification of 128 bytes of data has been completed, exit program-verify mode, wait for at least (t_{cpv}) μ s, then clear the SWE bit in FLMCR1. If reprogramming is necessary, set program mode again, and repeat the program/program-verify sequence as before. The maximum number of repetitions of the program/program-verify sequence is indicated by the maximum programming count (N). Leave a wait time of at least (t_{cswe}) μ s after clearing SWE.

Notes on Program/Program-Verify Procedure

1. The program/program-verify procedure for the H8/3062F-ZTAT B-mask version uses a 128-byte-unit programming algorithm.
Note that this is different from the procedure in the H8/3062F-ZTAT R-mask version (32-byte-unit programming).
In order to perform 128-byte-unit programming, the lower 8 bits of the write start address must be H'00 or H'80.
2. When performing continuous writing of 128-byte data to flash memory, byte-unit transfer should be used.
128-byte data transfer is necessary even when writing fewer than 128 bytes of data. Write H'FF data to the extra addresses.
3. Verify data is read in word units.
4. The write pulse is applied and a flash memory write executed while the P bit in FLMCR1 is set. In the H8/3062F-ZTAT B-mask version, write pulses should be applied as follows in the program/program-verify procedure to prevent voltage stress on the device and loss of write data reliability.
 - a. After write pulse application, perform a verify-read in program-verify mode and apply a write pulse again for any bits read as 1 (reprogramming processing). When all the 0-write bits in the 128-byte write data are read as 0 in the verify-read operation, the program/program-verify procedure is completed. In the H8/3062F-ZTAT B-mask version, the number of loops in reprogramming processing is guaranteed not to exceed the maximum value of the maximum programming count (N).
 - b. After write pulse application, a verify-read is performed in program-verify mode, and programming is judged to have been completed for bits read as 0. The following processing is necessary for programmed bits.

When programming is completed at an early stage in the program/program-verify procedure:

If programming is completed in the 1st to 6th reprogramming processing loop, additional programming should be performed on the relevant bits. Additional programming should only be performed on bits which first return 0 in a verify-read in certain reprogramming processing.

When programming is completed at a late stage in the program/program-verify procedure: If programming is completed in the 7th or later reprogramming processing loop, additional programming is not necessary for the relevant bits.

- c. If programming of other bits is incomplete in the 128 bytes, reprogramming processing should be executed. If a bit for which programming has been judged to be completed is read as 1 in a subsequent verify-read, a write pulse should again be applied to that bit.
5. The period for which the P bit in FLMCR1 is set (the write pulse width) should be changed according to the degree of progress through the program/program-verify procedure. For detailed wait time specifications, see section 22.5.6, Flash Memory Characteristics.

Item	Symbol	Item	Symbol
Wait time after P bit setting	t_{sp}	When reprogramming loop count (n) is 1 to 6	$t_{sp}30$
		When reprogramming loop count (n) is 7 or more	$t_{sp}200$
		In case of additional programming processing*	$t_{sp}10$

Note: * Additional programming processing is necessary only when the reprogramming loop count (n) is 1 to 6.

6. The program/program-verify flowchart for the H8/3062F-ZTAT B-mask version is shown in figure 19.11.

To cover the points noted above, bits on which reprogramming processing is to be executed, and bits on which additional programming is to be executed, must be determined as shown below.

Since reprogram data and additional-programming data vary according to the progress of the programming procedure, it is recommended that the following data storage areas (128 bytes each) be provided in RAM.

Reprogram Data Computation Table

(D)	Result of Verify-Read after Write Pulse Application (V)	(X) Result of Operation	Comments
0	0	1	Programming completed: reprogramming processing not to be executed
0	1	0	Programming incomplete: reprogramming processing to be executed
1	0	1	—
1	1	1	Still in erased state: no action

Legend:

(D): Source data of bits on which programming is executed

(X): Source data of bits on which reprogramming is executed

Additional-Programming Data Computation Table

(X')	Result of Verify-Read after Write Pulse Application (V)	(Y) Result of Operation	Comments
0	0	0	Programming by write pulse application judged to be completed: additional programming processing to be executed
0	1	1	Programming by write pulse application incomplete: additional programming processing not to be executed
1	0	1	Programming already completed: additional programming processing not to be executed
1	1	1	Still in erased state: no action

Legend:

(X'): Data of bits on which reprogramming is executed in a certain reprogramming loop

(Y): Data of bits on which additional programming is executed

- It is necessary to execute additional programming processing during the course of the H8/3062F-ZTAT B-mask version program/program-verify procedure. However, once 128-byte-unit programming is finished, additional programming should not be carried out on the same address area. When executing reprogramming, an erase must be executed first. Note that normal operation of reads, etc., is not guaranteed if additional programming is performed on addresses for which a program/program-verify operation has finished.

Note 6: Write Pulse Width

Number of Writes n	Write Time (tsp) μs
1	30
2	30
3	30
4	30
5	30
6	30
7	200
8	200
9	200
10	200
11	200
12	200
13	200
⋮	⋮
998	200
999	200
1000	200

Note: Use a 10 μs write pulse for additional programming.

- Notes:
- Data transfer is performed by byte transfer. The lower 8 bits of the first address written to must be H00 or H80. A 128-byte data transfer must be performed even if writing fewer than 128 bytes; in this case, HFF data must be written to the extra addresses.
 - Verify data is read in 16-bit (longword) units.
 - Reprogram data is determined by the operation shown in the table below (comparison between the data stored in the program data area and the verify data). Bits for which the reprogram data is 0 are programmed in the next reprogramming loop. Therefore, even bits for which programming has been completed will be subjected to programming once again if the result of the subsequent verify operation is NG. The contents of the reprogram data area and additional data area are modified as programming proceeds.
 - A 128-byte area for storing program data, a 128-byte area for storing reprogram data, and a 128-byte area for storing additional data must be provided in RAM.
 - A write pulse of 30 μs or 200 μs is applied according to the progress of the programming operation. See Note 6 for details of the pulse widths. When writing of additional-programming data is executed, a 10 μs write pulse should be applied. Reprogram data 'X' means reprogram data when the write pulse is applied.
 - The wait times and value of N are shown in section 22.5.6, Flash Memory.

Reprogram Data Computation Table

Original Data (D)	Verify Data (V)	Reprogram Data (X)	Comments
0	0	1	Programming completed
0	1	0	Programming incomplete; reprogram
1	0	1	Still in erased state; no action
1	1	1	Still in erased state; no action

Additional-Programming Data Computation Table

Reprogram Data (X)	Verify Data (V)	Additional-Programming Data (Y)	Comments
0	0	0	Additional programming to be executed
0	1	1	Additional programming not to be executed
1	0	1	Additional programming not to be executed
1	1	1	Additional programming not to be executed

Figure 19.11 Program/Program-Verify Flowchart (128-Byte Programming)

19.6.3 Erase Mode

When erasing flash memory, the single-block erase flowchart shown in figure 19.12 should be followed.

The wait times after bits are set or cleared in the flash memory control register 1 (FLMCR1) and the maximum number of erase operations (N) are shown in table 22.40 in section 22.5.6, Flash Memory Characteristics.

To erase flash memory contents, make a 1-bit setting for the flash memory area to be erased in erase block register (EBR) at least (t_{sswe}) μ s after setting the SWE bit to 1 in FLMCR1. Next, the watchdog timer (WDT) is set to prevent overerasing due to program runaway, etc. Set a value greater than (t_{se}) ms + ($t_{sesu} + t_{ce} + t_{cesu}$) μ s as the WDT overflow period. Preparation for entering erase mode (erase setup) is performed next by setting the ESU bit in FLMCR1. The operating mode is then switched to erase mode by setting the E bit in FLMCR1 after the elapse of at least (t_{sesu}) μ s. The time during which the E bit is set is the flash memory erase time. Ensure that the erase time does not exceed (t_{se}) ms.

Note: With flash memory erasing, preprogramming (setting all memory data in the memory to be erased to all 0) is not necessary before starting the erase procedure.

19.6.4 Erase-Verify Mode

In erase-verify mode, data is read after memory has been erased to check whether it has been correctly erased.

After the elapse of the fixed erase time, clear the E bit in FLMCR1, then wait for at least (t_{ce}) μ s before clearing the ESU bit to exit erase mode. After exiting erase mode, the watchdog timer setting is also cleared. The operating mode is then switched to erase-verify mode by setting the EV bit in FLMCR1. Before reading in erase-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (t_{sev}) μ s or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (t_{sev}) μ s after the dummy write before performing this read operation. If the read data has been erased (all 1), a dummy write is performed to the next address, and erase-verify is performed. If the read data is unerased, set erase mode again, and repeat the erase/erase-verify sequence as before. The maximum number of repetitions of the erase/erase-verify sequence is indicated by the maximum erase count (N). When verification is completed, exit erase-verify mode, and wait for at least (t_{cev}) μ s. If erasure has been completed on all the erase blocks, clear the SWE bit in FLMCR1, and leave a wait time of at least (t_{cswe}) μ s.

If erasing multiple blocks, set a single bit in EBR for the next block to be erased, and repeat the erase/erase-verify sequence as before.

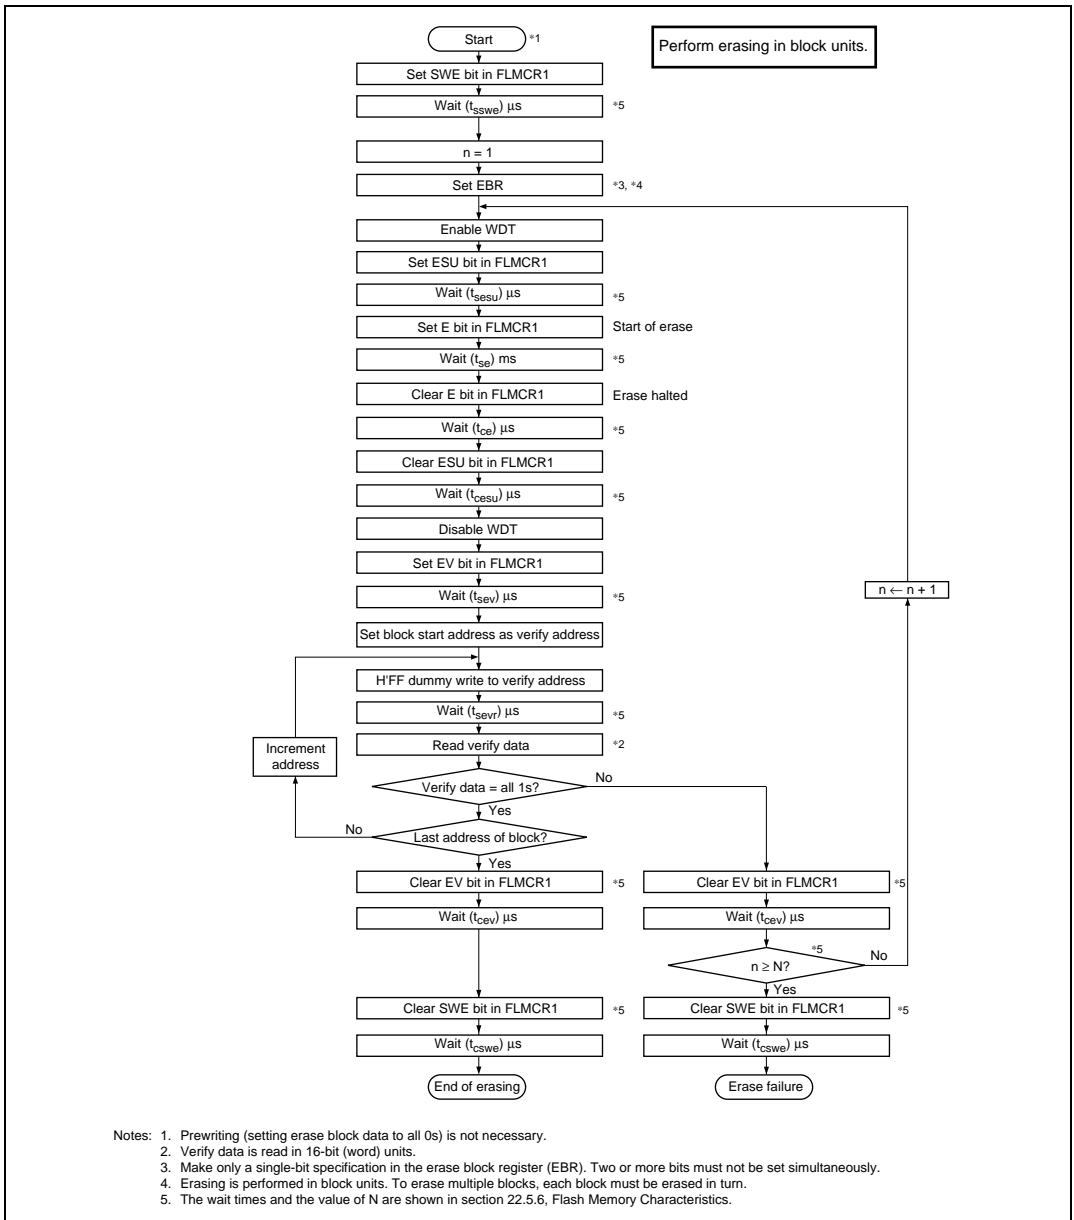

Figure 19.12 Erase/Eraser-Verify Flowchart (Single-Block Erasing)

19.7 Flash Memory Protection

There are three kinds of flash memory program/erase protection: hardware, software, and error protection.

19.7.1 Hardware Protection

Hardware protection refers to a state in which programming/erasing of flash memory is forcibly disabled or aborted. In this state, the settings in flash memory control register 1 (FLMCR1) and erase block register (EBR) are reset. In the error protection state, the FLMCR1 and EBR settings are retained; the P bit and E bit can be set, but a transition is not made to program mode or erase mode (See table 19.9).

Table 19.9 Hardware Protection

Item	Description	Function		
		Program	Erase	Verify
FWE pin protection	<ul style="list-style-type: none"> When a low level is input to the FWE pin, FLMCR1 and EBR are initialized, and the program/erase-protected state is entered. 	Not possible* ¹	Not possible* ³	Not possible
Reset/standby protection	<ul style="list-style-type: none"> In a reset (including a WDT overflow reset) and in standby mode, FLMCR1 and EBR are initialized, and the program/erase-protected state is entered. In a reset via the $\overline{\text{RES}}$ pin, the reset state is not entered unless the $\overline{\text{RES}}$ pin is held low until oscillation stabilizes after powering on. In the case of a reset during operation, hold the $\overline{\text{RES}}$ pin low for the $\overline{\text{RES}}$ pulse width specified in the AC Characteristics section*⁴. 	Not possible	Not possible* ³	Not possible
Error protection	<ul style="list-style-type: none"> When a microcomputer operation error (error generation (FLER = 1)) was detected while flash memory was being programmed/erased, error protection is enabled. At this time, the FLMCR1 and EBR settings are held, but programming/erasing is aborted at the time the error was generated. Error protection is released only by a reset via the $\overline{\text{RES}}$ pin or a WDT reset, or in the hardware standby mode. 	Not possible	Not possible* ³	Possible* ²

- Notes:
1. The RAM area that overlapped flash memory is deleted.
 2. It is possible to perform a program-verify operation on the 128 bytes being programmed, or an erase-verify operation on the block being erased.
 3. All blocks are unerasable and block-by-block specification is not possible.
 4. See section 4.2.2, Reset Sequence, and section 19.11, Flash Memory Programming and Erasing Precautions. The H8/3062F-ZTAT B-mask version requires a minimum of 20 system clock cycles for a reset during operation.

19.7.2 Software Protection

Software protection can be implemented by setting the erase block register (EBR) and the RAMS bit in the RAM control register (RAMCR). With software protection, setting the P or E bit in the flash memory control register 1 (FLMCR1) does not cause a transition to program mode or erase mode (See table 19.10).

Table 19.10 Software Protection

Item	Description	Functions		
		Program	Erase	Verify
Block protection	<ul style="list-style-type: none"> • Erase protection can be set for individual blocks by settings in erase block register (EBR)^{*2}. However, programming protection is disabled. • Setting EBR to H'00 places all blocks in the erase-protected state. 	—	Not possible	Possible
Emulation protection	<ul style="list-style-type: none"> • Setting the RAMS bit 1 in RAMCR places all blocks in the program/erase-protected state. 	Not possible ^{*1}	Not possible ^{*3}	Possible

- Notes:
1. The RAM area overlapping flash memory can be written to.
 2. When not erasing, set EBR to H'00.
 3. All blocks are unerasable and block-by-block specification is not possible.

19.7.3 Error Protection

In error protection, an error is detected when MCU runaway occurs during flash memory programming/erasing*¹, or operation is not performed in accordance with the program/erase algorithm, and the program/erase operation is aborted. Aborting the program/erase operation prevents damage to the flash memory due to overprogramming or overerasing.

If the MCU malfunctions during flash memory programming/erasing, the FLER bit is set to 1 in the flash memory status register (FLMSR2) and the error protection state is entered. FLMCR1, FLMCR2, and EBR settings*³ are retained, but program mode or erase mode is aborted at the point at which the error occurred. Program mode or erase mode cannot be re-entered by re-setting the P or E bit in FLMCR. However, PV and EV bit setting is enabled, and a transition can be made to verify mode*².

FLER bit setting conditions are as follows:

1. When flash memory is read during programming/erasing (including a vector read or instruction fetch)
2. Immediately after the start of exception handling during programming/erasing (excluding reset, illegal instruction, trap instruction, and division-by-zero exception handling)
3. When a SLEEP instruction (including software standby) is executed during programming/erasing
4. When the bus is released during programming/erasing

Error protection is released only by a $\overline{\text{RES}}$ pin or WDT reset, or in hardware standby mode.

- Notes:
1. State in which the P bit or E bit in FLMCR1 is set to 1. Note that NMI input is disabled in this state.
 2. It is possible to perform a program-verify operation on the 128 bytes being programmed, or an erase-verify on the block being erased.
 3. FLMCR1 and EBR can be written to. However, the registers are initialized if a transition is made to software standby mode while in the error protection state.

Figure 19.13 shows the flash memory state transition diagram.

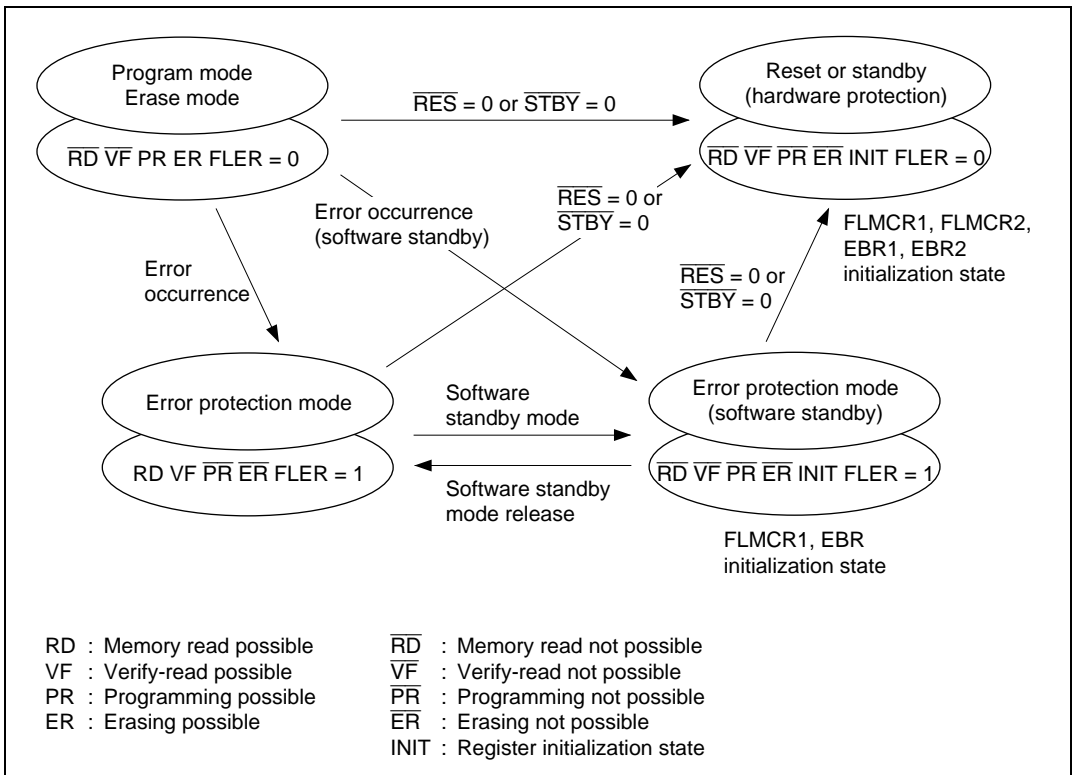

Figure 19.13 Flash Memory State Transitions
(When High Level is Applied to FWE Pin in Mode 5 or 7 (On-Chip ROM Enabled))

The error protection function is invalid for abnormal operations other than the FLER bit setting conditions. Also, if a certain time has elapsed before this protection state is entered, damage may already have been caused to the flash memory. Consequently, this function cannot provide complete protection against damage to flash memory.

To prevent such abnormal operations, therefore, it is necessary to ensure correct operation in accordance with the program/erase algorithm, with the flash write enable (FWE) voltage applied, and to conduct constant monitoring for MCU errors, internally and externally, using the watchdog timer or other means. There may also be cases where the flash memory is in an erroneous programming or erroneous erasing state at the point of transition to this protection mode, or where programming or erasing is not properly carried out because of an abort. In cases such as these, a forced recovery (program rewrite) must be executed using boot mode. However, it may also happen that boot mode cannot be normally initiated because of overprogramming or overerasing.

19.8 Flash Memory Emulation in RAM

As flash memory programming and erasing takes time, it may be difficult to carry out tuning by writing parameters and other data in real time. In this case, real-time programming of flash memory can be emulated by overlapping part of RAM (H'FFF000 to H'FFF3FF) onto a small block area in flash memory. This RAM area change is executed by means of bits 3 to 1 in the RAM control register (RAMCR). After the RAM area change, access is possible both from the area overlapped onto flash memory and from the original area (H'FFF000 to H'FFF3FF). For details of RAMCR and the RAM area setting method, see section 19.3.4, RAM Control Register (RAMCR).

Example of Emulation of Real-Time Flash Memory Programming: In the following example, RAM area H'FFF000 to H'FFF3FF is overlapped onto flash memory area EB2 (H'FFF000 to H'FFF3FF).

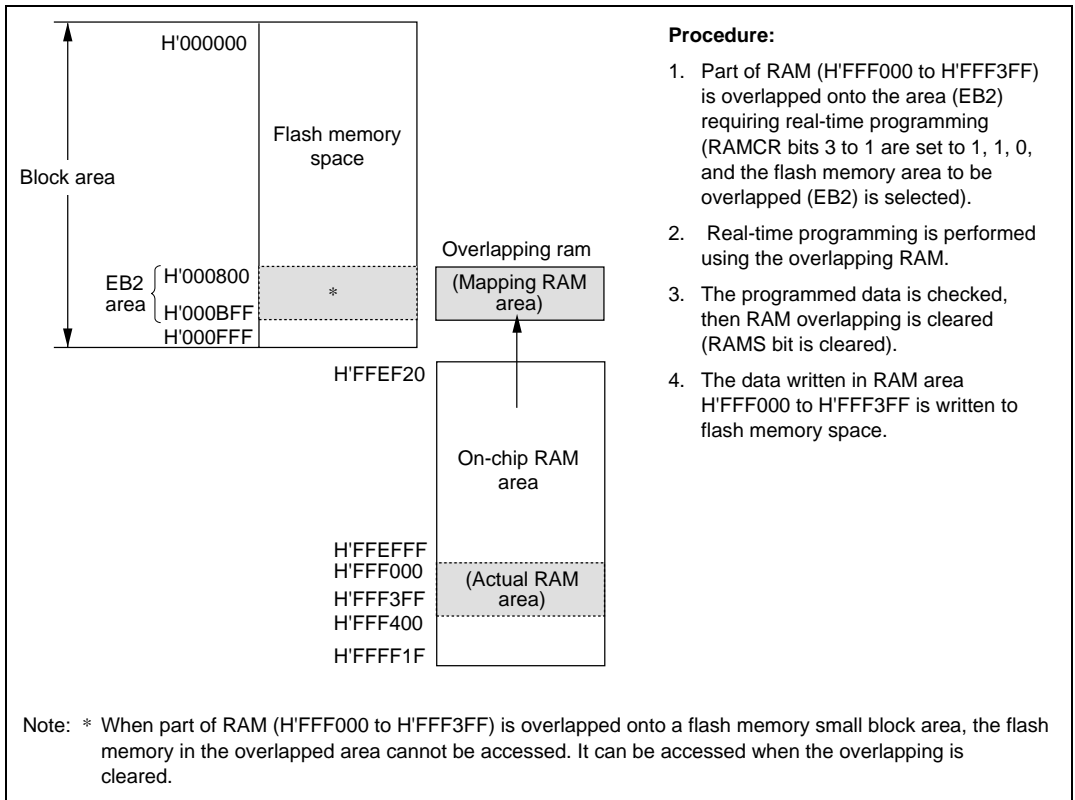

Figure 19.14 Example of RAM Overlap Operation

Notes on Use of Emulation in RAM:

1. Flash write enable (FWE) application and releasing
As in on-board program mode, care is required when applying and releasing FWE to prevent erroneous programming or erasing. To prevent erroneous programming and erasing due to program runaway during FWE application, in particular, the watchdog timer should be set when the PSU, P, ESU, or E bit is set to 1 in FLMCR1, even while the emulation function is being used. For details, see section 19.11, Flash Memory Programming and Erasing Precautions.
2. NMI input disabling conditions
When the emulation function is used, NMI input is disabled when the P bit or E bit is set to 1 in FLMCR1, in the same way as with normal programming and erasing.
The P and E bits are cleared by a reset (including a watchdog timer reset), in standby mode, when a high level is not being input to the FWE pin, or when the SWE bit in FLMCR1 is 0 while a high level is being input to the FWE pin.
3. When the RAMS bit is set to 1, program/erase protection is enabled for all blocks regardless of the value of RAM2 to RAM0 (emulation protection). In this state, setting the P or E bit in FLMCR1 will not cause a transition to program mode or erase mode. When actually programming or erasing a flash memory area, the RAMS bit should be cleared to 0.
4. A RAM area cannot be erased by execution of software in accordance with the erase algorithm while flash memory emulation in RAM is being used.
5. Block area EB0 contains the vector table. When performing RAM emulation, the vector table is needed in the overlap RAM.

19.9 NMI Input Disabling Conditions

All interrupts, including NMI input, should be disabled while flash memory is being programmed or erased (while the P bit or E bit is set in FLMCR1), and while the boot program is executing in boot mode^{*1}, to give priority to the program or erase operation. There are three reasons for this:

1. NMI input during programming or erasing might cause a violation of the programming or erasing algorithm, with the result that normal operation could not be assured.
2. In the NMI exception handling sequence during programming or erasing, the vector would not be read correctly^{*2}, possibly resulting in MCU runaway.
3. If NMI input occurred during boot program execution, it would not be possible to execute the normal boot mode sequence.

For these reasons, in on-board programming mode alone there are conditions for disabling NMI input, as an exception to the general rule. However, this provision does not guarantee normal erasing and programming or MCU operation. All interrupt requests (exception handling and bus release), including NMI, must therefore be restricted inside and outside the MCU during FWE application. NMI input is also disabled in the error protection state and while the P or E bit remains set in FLMCR1 during flash memory emulation in RAM.

- Notes:
1. This is the interval until a branch is made to the boot program area in the on-chip RAM (This branch takes place immediately after transfer of the user program is completed). Consequently, after the branch to the RAM area, NMI input is enabled except during programming and erasing. Interrupt requests must therefore be disabled inside and outside the MCU until the user program has completed initial programming (including the vector table and the NMI interrupt handling routine).
 2. The vector may not be read correctly in this case for the following two reasons:
 - If flash memory is read while being programmed or erased (while the P bit or E bit is set in FLMCR1), correct read data will not be obtained (undetermined values will be returned).
 - If the entry in the interrupt vector table has not been programmed yet, interrupt exception handling will not be executed correctly.

19.10 Flash Memory PROM Mode

The H8/3062F-ZTAT B-mask version has a PROM mode as well as the on-board programming modes for programming and erasing flash memory. In PROM mode, the on-chip ROM can be freely programmed using a general-purpose PROM writer that supports the Renesas microcomputer device type with 128-kbyte on-chip flash memory.

19.10.1 Socket Adapters and Memory Map

In PROM mode using a PROM writer, memory reading (verification) and writing and flash memory initialization (total erasure) can be performed. For these operations, a special socket adapter is mounted in the PROM writer. The socket adapter product codes are given in table 19.11. In the H8/3062F-ZTAT B-mask version PROM mode, only the socket adapters shown in this table should be used.

Table 19.11 H8/3062F-ZTAT B-Mask Version Socket Adapter Product Codes

Product Code	Package	Socket Adapter Product Code	Manufacturer
HD64F3062BF	100-pin QFP (FP-100B)	ME3064ESHF1H	MINATO ELECTRONICS INC.
HD64F3062BTE	100-pin TQFP (TFP-100B)	ME3064ESNF1H	
HD64F3062BFP	100-pin QFP (FP-100A)	ME3064ESFF1H	
HD64F3062BF	100-pin QFP (FP-100B)	HF306BQ100D4001	DATA I/O JAPAN CO.
HD64F3062BTE	100-pin TQFP (TFP-100B)	HF306BT100D4001	
HD64F3062BFP	100-pin QFP (FP-100A)	HF306AQ100D4001	

Figure 19.15 shows the memory map in PROM mode.

Figure 19.15 Memory Map in PROM Mode

19.10.2 Notes on Use of PROM Mode

1. A write to a 128-byte programming unit in PROM mode should be performed once only. Erasing must be carried out before reprogramming an address that has already been programmed.
2. When using a PROM writer to reprogram a device on which on-board programming/erasing has been performed, it is recommended that erasing be carried out before executing programming.
3. The memory is initially in the erased state when the device is shipped by Renesas. For samples for which the erasure history is unknown, it is recommended that erasing be executed to check and correct the initialization (erase) level.
4. The H8/3062F-ZTAT B-mask version does not support a product identification mode as used with general-purpose EPROMs, and therefore the device name cannot be set automatically in the PROM writer.
5. Refer to the instruction manual provided with the socket adapter, or other relevant documentation, for information on PROM writers and associated program versions that are compatible with the PROM mode of the H8/3062F-ZTAT B-mask version.

19.11 Flash Memory Programming and Erasing Precautions

Precautions concerning the use of on-board programming mode, the RAM emulation function, and PROM mode are summarized below.

1. Use the specified voltages and timing for programming and erasing.

Applied voltages in excess of the rating can permanently damage the device. Use a PROM programmer that supports the Renesas microcomputer device type with 128-kbyte on-chip flash memory.

2. Powering on and off (See figures 19.16 to 19.18)

Do not apply a high level to the FWE pin until V_{CC} has stabilized. Also, drive the FWE pin low before turning off V_{CC} .

When applying or disconnecting V_{CC} power, fix the FWE pin low and place the flash memory in the hardware protection state.

The power-on and power-off timing requirements should also be satisfied in the event of a power failure and subsequent recovery. Failure to do so may result in overprogramming or overerasing due to MCU runaway, and loss of normal memory cell operation.

3. FWE application/disconnection

FWE application should be carried out when MCU operation is in a stable condition. If MCU operation is not stable, fix the FWE pin low and set the protection state.

The following points must be observed concerning FWE application and disconnection to prevent unintentional programming or erasing of flash memory:

- Apply FWE when the V_{CC} voltage has stabilized within its rated voltage range.
If FWE is applied when the MCU's V_{CC} power supply is not within its rated voltage range, MCU operation will be unstable and flash memory may be erroneously programmed or erased.

- Apply FWE when oscillation has stabilized (after the elapse of the oscillation settling time).

When V_{CC} power is turned on, hold the \overline{RES} pin low for the duration of the oscillation settling time before applying FWE. Do not apply FWE when oscillation has stopped or is unstable.

- In boot mode, apply and disconnect FWE during a reset.

In a transition to boot mode, FWE = 1 input and MD₂ to MD₀ setting should be performed while the \overline{RES} input is low. FWE and MD₂ to MD₀ pin input must satisfy the mode programming setup time (t_{MDS}) with respect to the reset release timing. When making a transition from boot mode to another mode, also, a mode programming setup time is necessary with respect to the reset release timing.

In a reset during operation, the \overline{RES} pin must be held low for a minimum of 20 system clock cycles.

- In user program mode, FWE can be switched between high and low level regardless of \overline{RES} input.

FWE input can also be switched during execution of a program in flash memory.

- Do not apply FWE if program runaway has occurred.

During FWE application, the program execution state must be monitored using the watchdog timer or some other means.

- Disconnect FWE only when the SWE, ESU, PSU, EV, PV, E, and P bits in FLMCR1 are cleared.

Make sure that the SWE, ESU, PSU, EV, PV, E, and P bits are not set by mistake when applying or disconnecting FWE.

4. Do not apply a constant high level to the FWE pin.

To prevent erroneous programming or erasing due to program runaway, etc., apply a high level to the FWE pin only when programming or erasing flash memory (including execution of flash memory emulation using RAM). A system configuration in which a high level is constantly

applied to the FWE pin should be avoided. Also, while a high level is applied to the FWE pin, the watchdog timer should be activated to prevent overprogramming or overerasing due to program runaway, etc.

5. Use the recommended algorithm when programming and erasing flash memory.

The recommended algorithm enables programming and erasing to be carried out without subjecting the device to voltage stress or sacrificing program data reliability. When setting the PSU or ESU bit in FLMCR1, the watchdog timer should be set beforehand as a precaution against program runaway, etc.

Also note that access to the flash memory space by means of a MOV instruction, etc., is not permitted while the P bit or E bit is set.

6. Do not set or clear the SWE bit during execution of a program in flash memory.

Clear the SWE bit before executing a program or reading data in flash memory. When the SWE bit is set, data in flash memory can be rewritten, but flash memory should only be accessed for verify operations (verification during programming/erasing).

Similarly, when using the RAM emulation function while a high level is being input to the FWE pin, the SWE bit must be cleared before executing a program or reading data in flash memory. However, the RAM area overlapping flash memory space can be read and written to regardless of whether the SWE bit is set or cleared.

A wait time is necessary after the SWE bit is cleared. For details see table 22.40 in section 22.5.6, Flash Memory Characteristics.

7. Do not use interrupts while flash memory is being programmed or erased.

All interrupt requests, including NMI, should be disabled during FWE application to give priority to program/erase operations (including emulation in RAM).

Bus release must also be disabled.

8. Do not perform additional programming. Erase the memory before reprogramming.

In on-board programming, perform only one programming operation on a 128-byte programming unit block. Programming should be carried out with the entire programming unit block erased.

9. Before programming, check that the chip is correctly mounted in the PROM writer.

Overcurrent damage to the device can result if the index marks on the PROM writer socket, socket adapter, and chip are not correctly aligned.

10. Do not touch the socket adapter or chip during programming.

Touching either of these can cause contact faults and write errors.

11. A wait time of 100 μ s or more is necessary when performing a read after a transition to normal mode from program, erase, or verify mode.

12. Use byte access on the registers that control the flash memory (FLMCR1, FLMCR2, EBR, and RAMCR).

Figure 19.16 Power-On/Off Timing (Boot Mode)

19.12 Masked ROM (H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, H8/3060 Masked ROM B-Mask Version) Overview

19.12.1 Block Diagram

Figure 19.19 shows a block diagram of the ROM.

Figure 19.19 ROM Block Diagram (H8/3062 Masked ROM B-Mask Version)

19.13 Notes on Ordering Masked ROM Version Chips

When ordering H8/3062, H8/3061, and H8/3060 with masked ROM, note the following.

1. When ordering by means of an EPROM, use a 128-kbyte one.
2. Fill all unused addresses with H'FF as shown in figure 19.20 to make the ROM data size 128-kbytes for the H8/3062, H8/3061, and H8/3060 masked ROM versions, which incorporate different sizes of ROM. This applies to ordering by means of an EPROM and by means of data transmission.

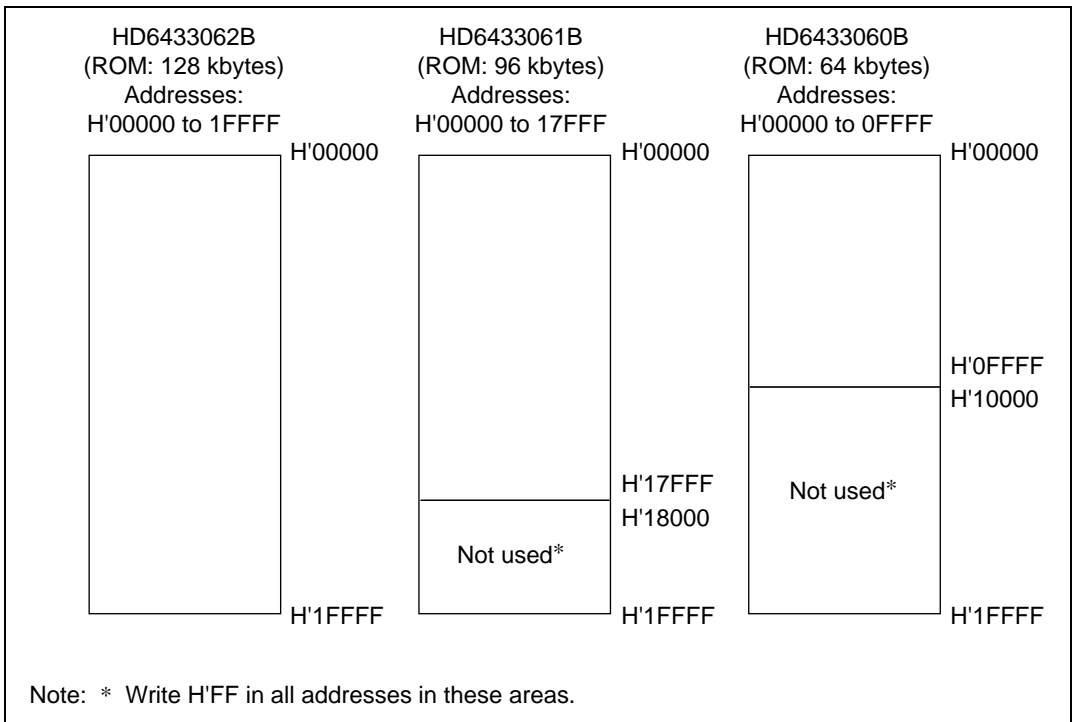

Figure 19.20 Masked ROM Addresses and Data

3. The flash memory control registers (FLMCR, EBR, RAMCR, FLMSR, FLMCR1, FLMCR2, EBR1, and EBR2) used by the versions with on-chip flash memory are not provided in the masked ROM versions. Reading the corresponding addresses in a masked ROM version will always return 1s, and writes to these addresses are disabled. This must be borne in mind when switching from a flash memory version to a masked ROM version.

19.14 Notes when Converting the F-ZTAT Application Software to the Masked ROM Versions

Please note the following when converting the F-ZTAT application software to the masked ROM versions.

The values read from the internal registers for the flash ROM in the masked ROM version and F-ZTAT version differ as follows.

Register	Bit	Value	Status	
			F-ZTAT Version	Masked ROM Version
FLMCR1	FWE	0	Application software running	— (Is not read out)
		1	Programming	Application software running (This bit is always read as 1)

Note: This difference applies to all the F-ZTAT versions and all the masked ROM versions that have different ROM size.

Section 20 Clock Pulse Generator

20.1 Overview

The H8/3062 Group has a built-in clock pulse generator (CPG) that generates the system clock (ϕ) and other internal clock signals ($\phi/2$ to $\phi/4096$). After duty adjustment, a frequency divider divides the clock frequency to generate the system clock (ϕ). The system clock is output at the ϕ pin*¹ and furnished as a master clock to prescalers that supply clock signals to the on-chip supporting modules. Frequency division ratios of 1/1, 1/2, 1/4, and 1/8 can be selected for the frequency divider by settings in a division control register (DIVCR)*². Power consumption in the chip is reduced in almost direct proportion to the frequency division ratio.

- Notes:
1. Usage of the ϕ pin differs depending on the chip operating mode and the PSTOP bit setting in the module standby control register (MSTCR). For details, see section 21.7, System Clock Output Disabling Function.
 2. The division ratio of the frequency divider can be changed dynamically during operation. The clock output at the ϕ pin also changes when the division ratio is changed. The frequency output at the ϕ pin is shown below.

$$\phi = \text{EXTAL} \times n$$

where, EXTAL : Frequency of crystal resonator or external clock signal

n : Frequency division ratio (n = 1/1, 1/2, 1/4, or 1/8)

20.1.1 Block Diagram

Figure 20.1 shows a block diagram of the clock pulse generator.

Figure 20.1 Block Diagram of Clock Pulse Generator

20.2 Oscillator Circuit

Clock pulses can be supplied by connecting a crystal resonator, or by input of an external clock signal.

20.2.1 Connecting a Crystal Resonator

Circuit Configuration: A crystal resonator can be connected as in the example in figure 20.2. Damping resistance R_d should be selected according to table 20.1 (1), and external capacitances C_{L1} and C_{L2} according to table 20.1 (2). An AT-cut parallel-resonance crystal should be used.

Figure 20.2 Connection of Crystal Resonator (Example)

If a crystal resonator with a frequency higher than 20 MHz is connected, the external load capacitance values in table 20.1 (2) should not exceed 10 [pF]. Also, in order to improve the accuracy of the oscillation frequency, a thorough study of oscillation matching evaluation, etc., should be carried out when deciding the circuit constants.

Table 20.1 (1) Damping Resistance Value

Damping Resistance Value	Frequency f (MHz)							
	2	2 < f ≤ 4	4 < f ≤ 8	8 < f ≤ 10	10 < f ≤ 13	13 < f ≤ 16	16 < f ≤ 18	18 < f ≤ 25
Rd (Ω)	1 k	500	200	0	0	0	0	0

Note: A crystal resonator between 2 MHz and 25 MHz can be used. If the chip is to be operated at less than 2 MHz, the on-chip frequency divider should be used (A crystal resonator of less than 2 MHz cannot be used).

Table 20.1 (2) External Capacitance Values

External Capacitance Value	5 V Version		Low-Voltage Version
	20 < f ≤ 25	2 ≤ f ≤ 20	2 ≤ f ≤ 13
$C_{L1} = C_{L2}$ (pF)	10	10 to 22	10 to 22

Note: * Conditions for the H8/3064F-ZTAT B-mask version and H8/3062F-ZTAT B-mask version.

Crystal Resonator: Figure 20.3 shows an equivalent circuit of the crystal resonator. The crystal resonator should have the characteristics listed in table 20.2.

Figure 20.3 Crystal Resonator Equivalent Circuit

Table 20.2 Crystal Resonator Parameters

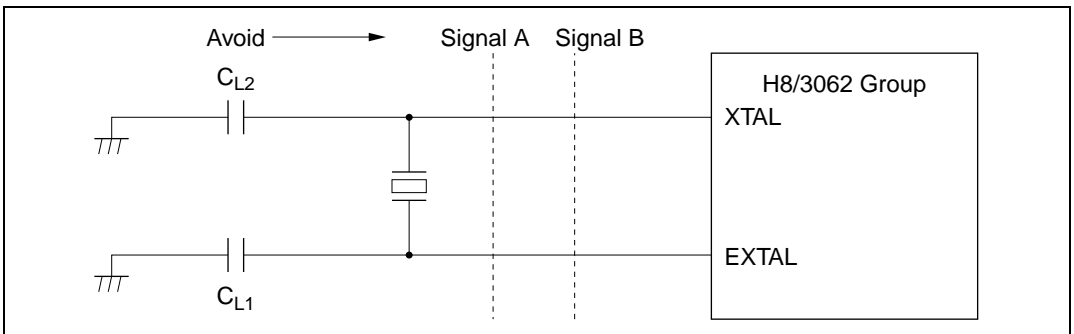

Frequency (MHz)	2	4	8	10	12	16	18	20	25
Rs max (Ω)	500	120	80	70	60	50	40	40	40
Co (pF)	7 pF max								

Use a crystal resonator with a frequency equal to the system clock frequency (ϕ).

Notes on Board Design: When a crystal resonator is connected, the following points should be noted:

Other signal lines should be routed away from the oscillator circuit to prevent induction from interfering with correct oscillation. See figure 20.4.

When the board is designed, the crystal resonator and its load capacitors should be placed as close as possible to the XTAL and EXTAL pins.

**Figure 20.4 Oscillator Circuit Block Board Design Precautions**

20.2.2 External Clock Input

Circuit Configuration: An external clock signal can be input as shown in the examples in figure 20.5. If the XTAL pin is left open, the stray capacitance should not exceed 10 pF. If the stray capacitance at the XTAL pin exceeds 10 pF in configuration a, use the connection shown in configuration b instead, and hold the external clock high in standby mode.

Figure 20.5 External Clock Input (Examples)

External Clock: The external clock frequency should be equal to the system clock frequency when not divided by the on-chip frequency divider. Table 20.3 shows the clock timing, figure 20.6 shows the external clock input timing, and figure 20.7 shows the external clock output settling delay timing. When the appropriate external clock is input via the EXTAL pin, its waveform is corrected by the on-chip oscillator and duty adjustment circuit.

When the appropriate external clock is input via the EXTAL pin, its waveform is corrected by the on-chip oscillator and duty adjustment circuit. The resulting stable clock is output to external devices after the external clock settling time (t_{DEXT}) has passed after the clock input. The system must remain reset with the reset signal low during t_{DEXT} , while the clock output is unstable.

Table 20.3 (1) Clock Timing for On-Chip Flash Memory Versions

Item	Symbol	$V_{\text{CC}} = 3.0 \text{ V}$ to 5.5 V		$V_{\text{CC}} = 5.0 \text{ V}$ $\pm 10\%$		Unit	Test Conditions

**Figure 20.6 External Clock Input Timing**

Figure 20.7 External Clock Output Settling Delay Timing

20.3 Duty Adjustment Circuit

When the oscillator frequency is 5 MHz or higher, the duty adjustment circuit adjusts the duty cycle of the clock signal from the oscillator to generate ϕ .

20.4 Prescalers

The prescalers divide the system clock (ϕ) to generate internal clocks ($\phi/2$ to $\phi/4096$).

20.5 Frequency Divider

The frequency divider divides the duty-adjusted clock signal to generate the system clock (ϕ). The frequency division ratio can be changed dynamically by modifying the value in $DIVCR$, as described below. Power consumption in the chip is reduced in almost direct proportion to the frequency division ratio. The system clock generated by the frequency divider can be output at the ϕ pin.

20.5.1 Register Configuration

Table 20.4 summarizes the frequency division register.

Table 20.4 Frequency Division Register

Address*	Name	Abbreviation	R/W	Initial Value
H'EE01B	Division control register	DIVCR	R/W	H'FC

Note: * Lower 20 bits of the address in advanced mode.

20.5.2 Division Control Register (DIVCR)

DIVCR is an 8-bit readable/writable register that selects the division ratio of the frequency divider.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DIV1	DIV0
Initial value	1	1	1	1	1	1	0	0
Read/Write	—	—	—	—	—	—	R/W	R/W

Reserved bits

Divide bits 1 and 0
These bits select the frequency division ratio

DIVCR is initialized to H'FC by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 2—Reserved: These bits cannot be modified and are always read as 1.

Bits 1 and 0—Divide (DIV1, DIV0): These bits select the frequency division ratio, as follows.

Bit 1 DIV1	Bit 0 DIV0	Frequency Division Ratio	
0	0	1/1	(Initial value)
0	1	1/2	
1	0	1/4	
1	1	1/8	

20.5.3 Usage Notes

The DIVCR setting changes the ϕ frequency, so note the following points.

- Select a frequency division ratio that stays within the assured operation range specified for the clock cycle time t_{cyc} in the AC electrical characteristics. Note that ϕ_{min} = lower limit of the operating frequency range. Ensure that ϕ is not below this lower limit.

Table 20.5 shows the operating frequency ranges of the various models in the H8/3062 Group.

Table 20.5 Comparison of H8/3062 Group Operating Frequency Ranges

		H8/3062 F-ZTAT R-Mask Version	H8/3062 F-ZTAT B-Mask Version	H8/3062 Masked ROM Version	H8/3061 Masked ROM Version	H8/3060 Masked ROM Version	H8/3064 F- ZTAT B-Mask Version
Guaranteed operating frequency range	4.5 to 5.5 V	1M to 20 MHz	2M to 25 MHz	1M to 20 MHz			2M to 25 MHz
	3.0 to 5.5 V	1M to 13 MHz	—	1M to 13 MHz			—
	2.7 to 5.5 V	—		1M to 10 MHz			—
Crystal oscillation range		2M to 20 MHz	2M to 25 MHz	2M to 20 MHz			2M to 25 MHz

- All on-chip module operations are based on ϕ . Note that the timing of timer operations, serial communication, and other time-dependent processing differs before and after any change in the division ratio. The waiting time for exit from software standby mode also changes when the division ratio is changed. For details, see section 21.4.3, Selection of Waiting Time for Exit from Software Standby Mode.

Section 21 Power-Down State

21.1 Overview

The H8/3062 Group has a power-down state that greatly reduces power consumption by halting the CPU, and a module standby function that reduces power consumption by selectively halting on-chip modules.

The power-down state includes the following three modes:

- Sleep mode
- Software standby mode
- Hardware standby mode

The module standby function can halt on-chip supporting modules independently of the power-down state. The modules that can be halted are the 16-bit timer, 8-bit timer, SCI0, SCI1, and A/D converter.

Table 21.1 indicates the methods of entering and exiting the power-down modes and module standby mode, and gives the status of the CPU and on-chip supporting modules in each mode.

Table 21.1 Power-Down State and Module Standby Function

Mode	State											Exiting Conditions		
	Entering Conditions	Clock	CPU	CPU Registers	16-Bit Timer	8-Bit Timer	SC10	SC11	A/D	Other Modules	RAM		ϕ clock Output ³	I/O Ports
Sleep mode	SLEEP instruction executed while SSBY = 0 in SYSCR	Active	Halted	Held	Active	Active	Active	Active	Active	Active	Held	ϕ output	Held	• Interrupt • RES • STBY
Software standby mode	SLEEP instruction executed while SSBY = 1 in SYSCR	Halted	Halted	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Held	High output	Held	• NMI • $\overline{IRQ_0}$ to $\overline{IRQ_2}$ • RES • STBY
Hardware standby mode	Low input at STBY pin	Halted	Halted	Undetermined	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Held ²	High impedance	High impedance	• STBY • RES
Module standby	Corresponding bit set to 1 in MSTRH and MSTRCL	Active	Active	—	Halted ¹ and reset	Halted ¹ and reset	Halted ¹ and reset	Halted ¹ and reset	Halted ¹ and reset	Active	—	High impedance ¹	—	• STBY • RES • Clear MSTR bit to 0 ⁴

Notes: 1. State in which the corresponding MSTR bit was set to 1. For details see section 21.2.2, Module Standby Control Register H (MSTRH) and section 21.2.3, Module Standby Control Register L (MSTRCL).

2. The RAME bit must be cleared to 0 in SYSCR before the transition from the program execution state to hardware standby mode.

3. When $P6_7$ is used as the ϕ output pin.

4. When a MSTR bit is set to '1', the registers of the corresponding on-chip supporting module are initialized. To restart the module, first clear the MSTR bit to 0, then set up the module registers again.

Legend:

SYSCR : System control register

SSBY : Software standby bit

MSTRH : Module standby control register H

MSTRCL : Module standby control register L

21.2 Register Configuration

The H8/3062 Group has a system control register (SYSCR) that controls the power-down state, and module standby control registers H (MSTCRH) and L (MSTCRL) that control the module standby function. Table 21.2 summarizes these registers.

Table 21.2 Control Register

Address*	Name	Abbreviation	R/W	Initial Value
H'EE012	System control register	SYSCR	R/W	H'09
H'EE01C	Module standby control register H	MSTCRH	R/W	H'78
H'EE01D	Module standby control register L	MSTCRL	R/W	H'00

Note: * Lower 20 bits of the address in advanced mode

21.2.1 System Control Register (SYSCR)

SYSCR is an 8-bit readable/writable register. Bit 7 (SSBY), bits 6 to 4 (STS2 to STS0), and bit 1 (SSOE) control the power-down state. For information on the other SYSCR bits, see section 3.3, System Control Register (SYSCR).

Bit 7—Software Standby (SSBY): Enables transition to software standby mode. When software standby mode is exited by an external interrupt, this bit remains set to 1 after the return to normal operation. To clear this bit, write 0.

Bit 7

SSBY	Description	
0	SLEEP instruction causes transition to sleep mode	(Initial value)
1	SLEEP instruction causes transition to software standby mode	

Bits 6 to 4—Standby Timer Select (STS2 to STS0): These bits select the length of time the CPU and on-chip supporting modules wait for the clock to settle when software standby mode is exited by an external interrupt. If the clock is generated by a crystal resonator, set these bits according to the clock frequency so that the waiting time will be at least 7 ms. See table 21.3. If an external clock is used, the choice of settings depends on the H8/3062 Group version.

- H8/3062F-ZTAT R-mask version, H8/3062 masked ROM version, H8/3061 masked ROM version, H8/3060 masked ROM version:
Any setting is permitted.
- H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version:

Choose a setting, according to the operating frequency, that gives a wait time of at least 100 μ s.

Bit 6 STS2	Bit 5 STS1	Bit 4 STS0	Description	
0	0	0	Waiting time = 8,192 states	(Initial value)
		1	Waiting time = 16,384 states	
	1	0	Waiting time = 32,768 states	
		1	Waiting time = 65,536 states	
1	0	0	Waiting time = 131,072 states	
1	0	1	Waiting time = 262,144 states	
1	1	0	Waiting time = 1,024 states	
1	1	1	Illegal setting	

Bit 1—Software Standby Output Port Enable (SSOE): Specifies whether the address bus and bus control signals (\overline{CS}_0 to \overline{CS}_7 , \overline{AS} , \overline{RD} , \overline{HWR} , and \overline{LWR}) are kept as outputs or fixed high, or placed in the high-impedance state in software standby mode.

Bit 1 SSOE	Description
0	In software standby mode, the address bus and bus control signals are all high-impedance (Initial value)
1	In software standby mode, the address bus retains its output state and bus control signals are fixed high

21.2.2 Module Standby Control Register H (MSTCRH)

MSTCRH is an 8-bit readable/writable register that controls output of the system clock (ϕ). It also controls the module standby function, which places individual on-chip supporting modules in the standby state. Module standby can be designated for the SCIO, SCII.

Bit	7	6	5	4	3	2	1	0
	PSTOP	—	—	—	—	—	MSTPH1	MSTPH0
Initial value	0	1	1	1	1	0	0	0
Read/Write	R/W	—	—	—	—	R/W	R/W	R/W

Reserved bits

ϕ clock stop
Enables or disables output of the system clock

Module standby H1 to 0
These bits select modules to be placed in standby

MSTCRH is initialized to H'78 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7— ϕ Clock Stop (PSTOP): Enables or disables output of the system clock (ϕ).

Bit 7 PSTOP	Description
0	System clock output is enabled (Initial value)
1	System clock output is disabled

Bits 6 to 3—Reserved: These bits cannot be modified and are always read as 1.

Bit 2—Reserved: This bit can be written and read.

Bit 1—Module Standby H1 (MSTPH1): Selects whether to place the SCI1 in standby.

Bit 1

MSTPH1	Description	
0	SCI1 operates normally	(Initial value)
1	SCI1 is in standby state	

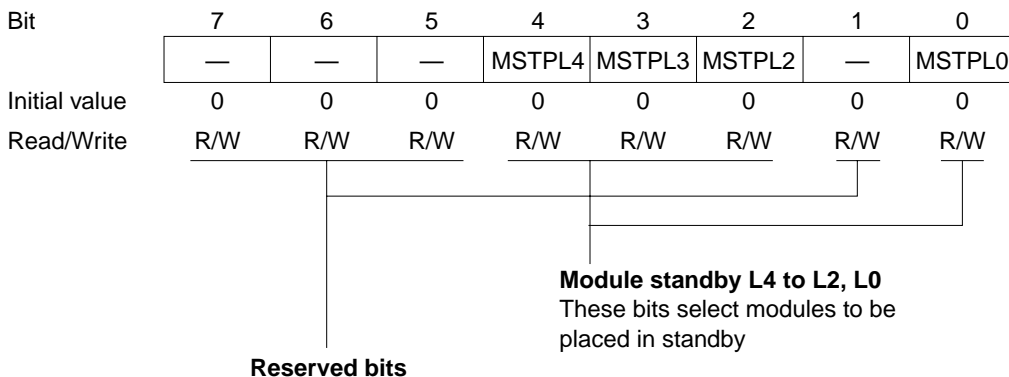

Bit 0—Module Standby H0 (MSTPH0): Selects whether to place the SCI0 in standby.

Bit 0

MSTPH0	Description	
0	SCI0 operates normally	(Initial value)
1	SCI0 is in standby state	

21.2.3 Module Standby Control Register L (MSTCRL)

MSTCRL is an 8-bit readable/writable register that controls the module standby function, which places individual on-chip supporting modules in the standby state. Module standby can be designated for 16-bit timer, 8-bit timer, and A/D converter modules.

MSTCRL is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 5—Reserved: This bit can be written and read.

Bit 4—Module Standby L4 (MSTPL4): Selects whether to place the 16-bit timer in standby.

Bit 4

MSTPL4	Description	
0	16-bit timer operates normally	(Initial value)
1	16-bit timer is in standby state	

Bit 3—Module Standby L3 (MSTPL3): Selects whether to place 8-bit timer channels 0 and 1 in standby.

Bit 3

MSTPL3	Description	
0	8-bit timer channels 0 and 1 operate normally	(Initial value)
1	8-bit timer channels 0 and 1 are in standby state	

Bit 2—Module Standby L2 (MSTPL2): Selects whether to place 8-bit timer channels 2 and 3 in standby.

Bit 2

MSTPL2	Description	
0	8-bit timer channels 2 and 3 operate normally	(Initial value)
1	8-bit timer channels 2 and 3 are in standby state	

Bit 1—Reserved: This bit can be written and read.

Bit 0—Module Standby L0 (MSTPL0): Selects whether to place the A/D converter in standby.

Bit 0

MSTPL0	Description	
0	A/D converter operates normally	(Initial value)
1	A/D converter is in standby state	

21.3 Sleep Mode

21.3.1 Transition to Sleep Mode

When the SSBY bit is cleared to 0 in SYSCR, execution of the SLEEP instruction causes a transition from the program execution state to sleep mode. Immediately after executing the SLEEP instruction the CPU halts, but the contents of its internal registers are retained. On-chip supporting modules do not halt in sleep mode. Modules which have been placed in standby by the module standby function, however, remain halted.

21.3.2 Exit from Sleep Mode

Sleep mode is exited by an interrupt, or by input at the $\overline{\text{RES}}$ or $\overline{\text{STBY}}$ pin.

Exit by Interrupt: An interrupt terminates sleep mode and causes a transition to the interrupt exception handling state. Sleep mode is not exited by an interrupt source in an on-chip supporting module if the interrupt is disabled in the on-chip supporting module. Sleep mode is not exited by an interrupt other than NMI if the interrupt is masked by interrupt priority settings and the settings of the I and UI bits in CCR, IPR.

Exit by $\overline{\text{RES}}$ Input: Low input at the $\overline{\text{RES}}$ pin exits from sleep mode to the reset state.

Exit by $\overline{\text{STBY}}$ Input: Low input at the $\overline{\text{STBY}}$ pin exits from sleep mode to hardware standby mode.

21.4 Software Standby Mode

21.4.1 Transition to Software Standby Mode

To enter software standby mode, execute the SLEEP instruction while the SSBY bit is set to 1 in SYSCR.

In software standby mode, current dissipation is reduced to an extremely low level because the CPU, clock, and on-chip supporting modules all halt. On-chip supporting modules are reset and halted. As long as the specified voltage is supplied, however, CPU register contents and on-chip RAM data are retained. The settings of the I/O ports also held. When the WDT is used as a watchdog timer ($\text{WT}/\overline{\text{IT}} = 1$), the TME bit must be cleared to 0 before setting SSBY. Also, when setting TME to 1, SSBY should be cleared to 0.

Clear the BRLE bit in BRCCR (inhibiting bus release) before making a transition to software standby mode.

21.4.2 Exit from Software Standby Mode

Software standby mode can be exited by input of an external interrupt at the NMI, $\overline{\text{IRQ}}_0$, $\overline{\text{IRQ}}_1$, or $\overline{\text{IRQ}}_2$ pin, or by input at the RES or $\overline{\text{STBY}}$ pin.

Exit by Interrupt: When an NMI, $\overline{\text{IRQ}}_0$, $\overline{\text{IRQ}}_1$, or $\overline{\text{IRQ}}_2$ interrupt request signal is received, the clock oscillator begins operating. After the oscillator settling time selected by bits STS2 to STS0 in SYSCR, stable clock signals are supplied to the entire chip, software standby mode ends, and interrupt exception handling begins. Software standby mode is not exited if the interrupt enable bits of interrupts $\overline{\text{IRQ}}_0$, $\overline{\text{IRQ}}_1$, and $\overline{\text{IRQ}}_2$ are cleared to 0, or if these interrupts are masked in the CPU.

Exit by $\overline{\text{RES}}$ Input: When the $\overline{\text{RES}}$ input goes low, the clock oscillator starts and clock pulses are supplied immediately to the entire chip. The $\overline{\text{RES}}$ signal must be held low long enough for the clock oscillator to stabilize. When $\overline{\text{RES}}$ goes high, the CPU starts reset exception handling.

Exit by $\overline{\text{STBY}}$ Input: Low input at the $\overline{\text{STBY}}$ pin causes a transition to hardware standby mode.

21.4.3 Selection of Waiting Time for Exit from Software Standby Mode

Bits STS2 to STS0 in SYSCR and bits DIV1 and DIV0 in DIVCR should be set as follows.

Crystal Resonator: Set STS2 to STS0, DIV1, and DIV0 so that the waiting time (for the clock to stabilize) is at least 7 ms. Table 21.3 indicates the waiting times that are selected by STS2 to STS0, DIV1, and DIV0 settings at various system clock frequencies.

When Using an External Clock

1. H8/3062F-ZTAT R-mask version, H8/3062 masked ROM version, H8/3061 masked ROM version, H8/3060 masked ROM version:
Any setting is permitted.
2. H8/3064F-ZTAT B-mask version, H8/3062F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version:
Set bits STS2 to STS0 and bits DIV0 and DIV1 to give a wait time of at least 100 μs .

Table 21.3 Clock Frequency and Waiting Time for Clock to Settle

DIV1	DIV0	STS2	STS1	STS0	Waiting Time	25 MHz	20 MHz	18 MHz	16 MHz	12 MHz	10 MHz	8 MHz	6 MHz	4 MHz	2 MHz	1MHz	Unit

21.4.4 Sample Application of Software Standby Mode

Figure 21.1 shows an example in which software standby mode is entered at the fall of NMI and exited at the rise of NMI.

With the NMI edge select bit (NMIEG) cleared to 0 in SYSCR (selecting the falling edge), an NMI interrupt occurs. Next the NMIEG bit is set to 1 (selecting the rising edge) and the SSBY bit is set to 1; then the SLEEP instruction is executed to enter software standby mode.

Software standby mode is exited at the next rising edge of the NMI signal.

Figure 21.1 NMI Timing for Software Standby Mode (Example)

21.4.5 Usage Note

The I/O ports retain their existing states in software standby mode. If a port is in the high output state, its output current is not reduced.

21.4.6 Cautions on Clearing the software Standby Mode of F-ZTAT Version

(1) Operation phenomena

When using operating mode 5, 6, or 7* (on-chip flash memory enabled), the first read of on-chip flash memory after exiting software standby mode may not be carried out correctly.

Software standby mode is exited by means of an external interrupt (via the NMI, $\overline{IRQ_0}$, $\overline{IRQ_1}$, or $\overline{IRQ_2}$ pin), the \overline{RES} pin, or the \overline{STBY} pin. In the case of an external interrupt via the NMI, $\overline{IRQ_0}$, $\overline{IRQ_1}$, or $\overline{IRQ_2}$ pin, the first read after exiting software standby mode is a read of the vector corresponding to the respective exception handling interrupt source. This vector may not be read correctly, resulting in program runaway.

Note: * Mode 5: expanded 16-Mbyte mode with on-chip ROM enabled

Mode 6: single-chip normal mode

Mode 7: single-chip advanced mode

(2) Exemplary procedures to avoid program runaway

This operation phenomenon can be avoided by writing or amending program code in accordance with the following procedures.

- (a) When using mode 5 or mode 7, assign addresses in the 64-kbyte space from H'00000 to H'0FFFF as the vector addresses for the external interrupts that clear software standby mode.
- (b) When using mode 6, change the mode to mode 7 in the program, and use change (a) above.

Note that it is necessary to change vector address assignments and to extend addresses as follows.

- Addresses H'DFFF and below (on-chip ROM area): H'xxxx → H'0xxxx
- Addresses H'E000 to H'E0FF (internal I/O registers-1): H'yyyy → H'Eyyyy
- Addresses H'EF20 and above (on-chip RAM area and internal I/O registers-2): H'zzzz → H'Fzzzz

(Where x, y and z are any hexadecimal numbers)

(3) Comparison of products in H8/3062 Group

Prior to week code "9k1" Restriction (2) applies. Take measures to prevent program runaway.	Week code "9k1" onward Restriction (2) does not apply.	Restriction (2) does not apply.	Restriction (2) does not apply.	Restriction (2) does not apply.

21.5 Hardware Standby Mode

21.5.1 Transition to Hardware Standby Mode

Regardless of its current state, the chip enters hardware standby mode whenever the $\overline{\text{STBY}}$ pin goes low. Hardware standby mode reduces power consumption drastically by halting all functions of the CPU, and on-chip supporting modules. All modules are reset except the on-chip RAM. As long as the specified voltage is supplied, on-chip RAM data is retained. I/O ports are placed in the high-impedance state.

Clear the RAME bit to 0 in SYSCR before $\overline{\text{STBY}}$ goes low to retain on-chip RAM data.

The inputs at the mode pins (MD2 to MD0) should not be changed during hardware standby mode.

21.5.2 Exit from Hardware Standby Mode

Hardware standby mode is exited by inputs at the $\overline{\text{STBY}}$ and $\overline{\text{RES}}$ pins. While $\overline{\text{RES}}$ is low, when $\overline{\text{STBY}}$ goes high, the clock oscillator starts running. $\overline{\text{RES}}$ should be held low long enough for the clock oscillator to settle. When $\overline{\text{RES}}$ goes high, reset exception handling begins, followed by a transition to the program execution state.

21.5.3 Timing for Hardware Standby Mode

Figure 21.2 shows the timing relationships for hardware standby mode. To enter hardware standby mode, first drive $\overline{\text{RES}}$ low, then drive $\overline{\text{STBY}}$ low. To exit hardware standby mode, first drive $\overline{\text{STBY}}$ high, wait for the clock to settle, then bring $\overline{\text{RES}}$ from low to high.

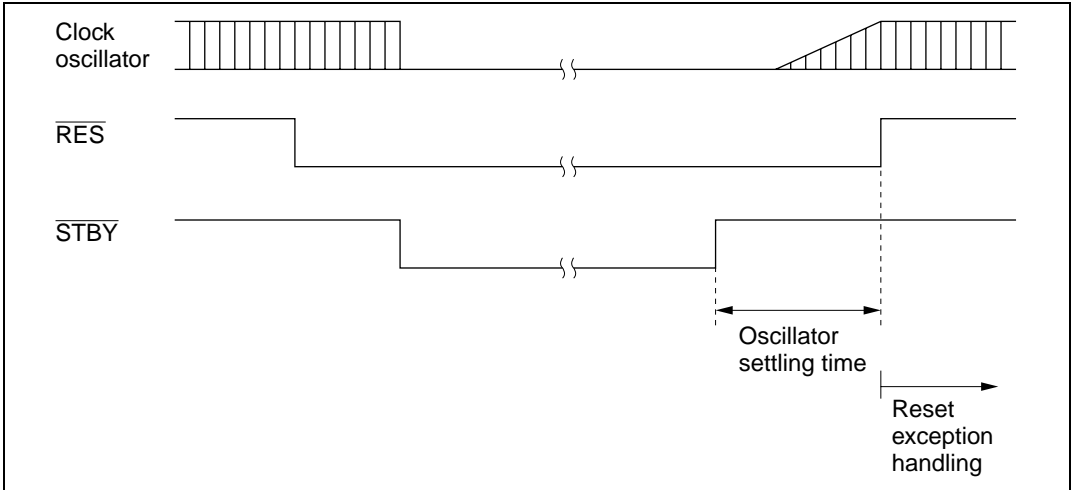

Figure 21.2 Hardware Standby Mode Timing

21.6 Module Standby Function

21.6.1 Module Standby Timing

The module standby function can halt several of the on-chip supporting modules (SCI1, SCI0, 16-bit timer, 8-bit timer, and A/D converter) independently in the power-down state. This standby function is controlled by bits MSTPH2 to MSTPH0 in MSTCRH and bits MSTPL7 to MSTPL0 in MSTCRL. When one of these bits is set to 1, the corresponding on-chip supporting module is placed in standby and halts at the beginning of the next bus cycle after the MSTCR write cycle.

21.6.2 Read/Write in Module Standby

When an on-chip supporting module is in module standby, read/write access to its registers is disabled. Read access always results in H'FF data. Write access is ignored.

21.6.3 Usage Notes

When using the module standby function, note the following points.

On-chip Supporting Module Interrupts: Before setting a module standby bit, first disable interrupts by that module. When an on-chip supporting module is placed in standby by the module standby function, its registers are initialized, including registers with interrupt request flags.

Pin States: Pins used by an on-chip supporting module lose their module functions when the module is placed in module standby. What happens after that depends on the particular pin. For details, see section 7, I/O Ports. Pins that change from the input to the output state require special care. For example, if SCI1 is placed in module standby, the receive data pin loses its receive data function and becomes a port pin. If its port DDR bit is set to 1, the pin becomes a data output pin, and its output may collide with external SCI transmit data. Data collision should be prevented by clearing the port DDR bit to 0 or taking other appropriate action.

Register Resetting: When an on-chip supporting module is halted by the module standby function, all its registers are initialized. To restart the module, after its MSTCR bit is cleared to 0, its registers must be set up again. It is not possible to write to the registers while the MSTCR bit is set to 1.

21.7 System Clock Output Disabling Function

Output of the system clock (ϕ) can be controlled by the PSTOP bit in MSTRCH. When the PSTOP bit is set to 1, output of the system clock halts and the ϕ pin is placed in the high-impedance state. Figure 21.3 shows the timing of the stopping and starting of system clock output. When the PSTOP bit is cleared to 0, output of the system clock is enabled. Table 21.4 indicates the state of the ϕ pin in various operating states.

Figure 21.3 Starting and Stopping of System Clock Output

Table 21.4 ϕ Pin State in Various Operating States

Operating State	PSTOP = 0	PSTOP = 1
Hardware standby	High impedance	High impedance
Software standby	Always high	High impedance
Sleep mode	System clock output	High impedance
Normal operation	System clock output	High impedance

Section 22 Electrical Characteristics

Table 22.1 shows the electrical characteristics of the various products in the H8/3062 Group.

Table 22.1 Electrical Characteristics of H8/3062 Group Products

Item		Symbol	Unit	H8/3062 F-ZTAT R-Mask Version	H8/3062, H8/3061, H8/3060	H8/3064 F-ZTAT B-Mask Version	H8/3062 F-ZTAT B-Mask Version	H8/3064 Masked ROM B-Mask Version	H8/3062, H8/3061, H8/3060 Masked ROM B-Mask Versions

	Other wait times			See table 22.20	—	See table 22.30	See table 22.49	—			

- Notes:
1. The lower limit of the operating temperature range for flash memory programming/erasing is 0°C .
 2. Connect an external capacitor between the V_{CL} pin and GND.
 3. See the DC Characteristics table for current dissipation during operation.
 4. Refer to the program/erase algorithms for details of flash memory characteristics.

22.1 Electrical Characteristics of H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, and H8/3060 Masked ROM Version

22.1.1 Absolute Maximum Ratings

Table 22.2 lists the absolute maximum ratings.

Table 22.2 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}	-0.3 to +7.0	V
Input voltage (except for port 7)	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (port 7)	V_{in}	-0.3 to $AV_{CC} + 0.3$	V
Reference voltage	V_{REF}	-0.3 to $AV_{CC} + 0.3$	V
Analog power supply voltage	AV_{CC}	-0.3 to +7.0	V
Analog input voltage	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
Operating temperature	T_{opr}	Regular specifications: -20 to +75	°C
		Wide-range specifications: -40 to +85	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

22.1.2 DC Characteristics

Table 22.3 lists the DC characteristics. Table 22.4 lists the permissible output currents.

Table 22.3 DC Characteristics (1)

Conditions: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5\text{ V}$ to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS} = 0\text{ V}^{*1}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to $+85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Schmitt trigger input voltages	Port A, P8 ₀ to P8 ₂	V_T^-	1.0	—	—	V

Also, the typ values for current dissipation are reference values.

Table 22.4 Permissible Output Currents

Conditions: $V_{CC} = 2.7\text{ V to }5.5\text{ V}$, $AV_{CC} = 2.7\text{ V to }5.5\text{ V}$, $V_{REF} = 2.7\text{ V to }AV_{CC}$,
 $V_{SS} = AV_{SS} = 0\text{ V}$, $T_a = -20^\circ\text{C to }+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C to }+85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, and 5	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Total of 20 pins in Ports 1, 2, and 5	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	$ I_{OH} $	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	$ \Sigma I_{OH} $	—	—	40	mA

- Notes: 1. To protect chip reliability, do not exceed the output current values in table 22.4.
2. When directly driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 22.1 and 22.4.

**Figure 22.1 Darlington Pair Drive Circuit (Example)**

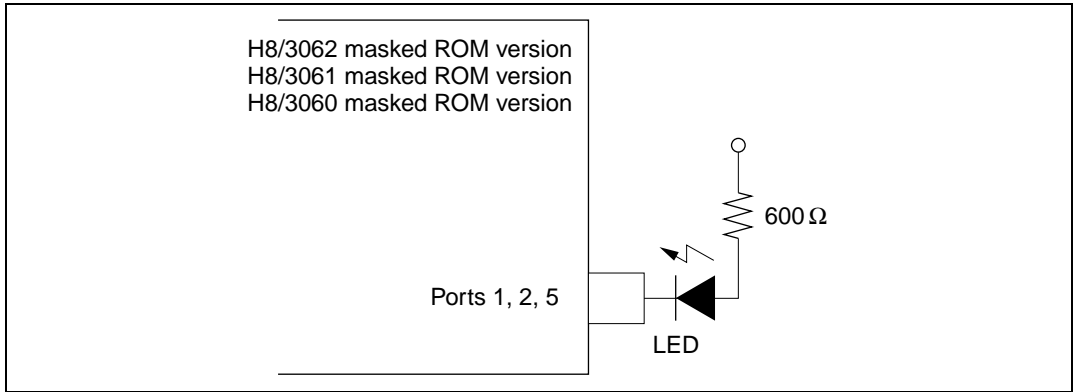

Figure 22.2 Sample LED Circuit

22.1.3 AC Characteristics

Clock timing parameters are listed in table 22.5, control signal timing parameters in table 22.6, and bus timing parameters in table 22.7. Timing parameters of the on-chip supporting modules are listed in table 22.8.

Table 22.5 Clock Timing

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications), $T_a = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ (wide-range specifications)

Condition A: $V_{CC} = 2.7$ to 5.5 V, $AV_{CC} = 2.7$ to 5.5 V, $V_{REF} = 2.7$ to AV_{CC} , $V_{SS} = AV_{SS} = 0$ V

Condition B: $V_{CC} = 3.0$ to 5.5 V, $AV_{CC} = 3.0$ to 5.5 V, $V_{REF} = 3.0$ to AV_{CC} , $V_{SS} = AV_{SS} = 0$ V

Condition C: $V_{CC} = 5.0$ V \pm 10%, $AV_{CC} = 5.0$ V \pm 10%, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0$ V

Item	Symbol	Condition						Unit	Test Conditions
		A		B		C			
		Min	Max	Min	Max	Min	Max

22.2 Electrical Characteristics of H8/3062F-ZTAT R-Mask Version

22.2.1 Absolute Maximum Ratings

Table 22.11 lists the absolute maximum ratings.

Table 22.11 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}	-0.3 to +7.0	V
Input voltage (FWE) ^{*1}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (except for port 7) ^{*1}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (port 7)	V_{in}	-0.3 to $AV_{CC} + 0.3$	V
Reference voltage	V_{REF}	-0.3 to $AV_{CC} + 0.3$	V
Analog power supply voltage	AV_{CC}	-0.3 to +7.0	V
Analog input voltage	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
Operating temperature	T_{opr}	Regular specifications: -20 to +75 ^{*2}	°C
		Wide-range specifications: -40 to +85 ^{*2}	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

Notes: 1. 12 V must not be applied to any pin, as this may cause permanent damage to the device.

2. The operating temperature range when programming and erasing the flash memory is:
 $T_a = 0$ to +75°C (regular specifications), $T_a = 0$ to +85°C (wide-range specifications).

22.2.2 DC Characteristics

Tables 22.12 lists the DC characteristics. Table 22.13 lists the permissible output currents.

Table 22.12 DC Characteristics (1)

Conditions: $V_{CC} = 5.0 \text{ V} \pm 10\%$, $AV_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{REF} = 4.5 \text{ V}$ to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS} = 0 \text{ V}^{*1}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to $+85^\circ\text{C}$ (wide-range specifications)
 [Programming/erasing conditions: $T_a = 0$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = 0$ to $+85^\circ\text{C}$ (wide-range specifications)]

	Module standby mode		—	24 (5.0 V)	51	mA	$f = 20 \text{ MHz}$	
	Standby mode			—	0.01	5.0	μA	$T_a \leq 50^\circ\text{C}$
				—	—	20.0	μA	$50^\circ\text{C} < T_a$
	Flash memory programming/erasing* ⁴			—	60	110	mA	$f = 20 \text{ MHz}$
Analog power supply current	During A/D conversion	AI_{CC}	—	0.6	1.5	mA		
	During A/D and D/A conversion		—	0.6	1.5	mA		
	Idle		—	0.01	5.0	μA	DASTE = 0	
Reference current	During A/D conversion	AI_{CC}	—	0.5	0.8	mA		
	During A/D and D/A conversion		—	2.0	3.0	mA		
	Idle		—	0.01	5.0	μA	DASTE = 0	
RAM standby voltage		V_{RAM}	2.0	—	—	V		

- Notes:
1. If the A/D converter is not used, do not leave the AV_{CC} , V_{REF} , and AV_{SS} pins open. Connect AV_{CC} and V_{REF} to V_{CC} , and connect AV_{SS} to V_{SS} .
 2. Current dissipation values are for $V_{IH\ min} = V_{CC} - 0.5\ V$ and $V_{IL\ max} = 0.5\ V$ with all output pins unloaded and the on-chip MOS pull-up transistors in the off state. The values are for $V_{RAM} \leq V_{CC} < 4.5\ V$, $V_{IH\ min} = V_{CC} \times 0.9$, and $V_{IL\ max} = 0.3\ V$.
 3. $I_{CC\ max}$ (normal operation) = $1.0\ (mA) + 0.90\ (mA/(MHz \times V)) \times V_{CC} \times f$
 $I_{CC\ max}$ (sleep mode) = $1.0\ (mA) + 0.65\ (mA/(MHz \times V)) \times V_{CC} \times f$
 $I_{CC\ max}$ (sleep mode + module standby mode)
= $1.0\ (mA) + 0.45\ (mA/(MHz \times V)) \times V_{CC} \times f$
The Typ values for power consumption are reference values.
 4. Sum of current dissipation in normal operation and current dissipation in program/erase operations.

Table 22.12 DC Characteristics (2)

Conditions: $V_{CC} = 3.0$ to 5.5 V, $AV_{CC} = 3.0$ to 5.5 V, $V_{REF} = 3.0$ V to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS} = 0$ V^{*1}, $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ (wide-range specifications)
 [Programming/erasing conditions: $V_{CC} = 3.0$ to 3.6 V, $T_a = 0$ to $+75^{\circ}\text{C}$
 (regular specifications), $T_a = 0$ to $+85^{\circ}\text{C}$ (wide-range specifications)]

	Idle		—	0.01	5.0	μA	$DASTE = 0$	
RAM standby voltage		V_{RAM}	2.0	—	—	V		

- Notes: 1. If the A/D converter is not used, do not leave the AV_{CC} , V_{REF} , and AV_{SS} pins open. Connect AV_{CC} and V_{REF} to V_{CC} , and connect AV_{SS} to V_{SS} .
2. Current dissipation values are for $V_{IH\ min} = V_{CC} - 0.5\text{ V}$ and $V_{IL\ max} = 0.5\text{ V}$ with all output pins unloaded and the on-chip MOS pull-up transistors in the off state. The values are for $V_{RAM} \leq V_{CC} < 4.5\text{ V}$, $V_{IH\ min} = V_{CC} \times 0.9$, and $V_{IL\ max} = 0.3\text{ V}$.

3. $I_{CC} \text{ max (normal operation)} = 1.0 \text{ (mA)} + 0.90 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$
 $I_{CC} \text{ max (sleep mode)} = 1.0 \text{ (mA)} + 0.65 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$
 $I_{CC} \text{ max (sleep mode + module standby mode)}$
 $= 1.0 \text{ (mA)} + 0.45 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$

The Typ values for power consumption are reference values.

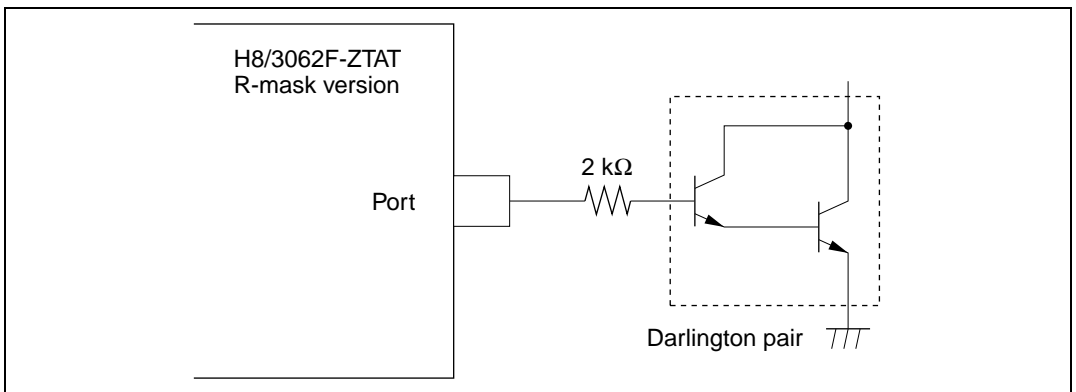

4. Sum of current dissipation in normal operation and current dissipation in program/erase operations.

Table 22.13 Permissible Output Currents

Conditions: $V_{CC} = 3.0\text{ V to }5.5\text{ V}$, $AV_{CC} = 3.0\text{ V to }5.5\text{ V}$, $V_{REF} = 3.0\text{ V to }AV_{CC}$,
 $V_{SS} = AV_{SS} = 0\text{ V}$, $T_a = -20^\circ\text{C to }+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C to }+85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, and 5	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Sum of 20 pins in ports 1, 2, and 5	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	$ -I_{OH} $	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	$ \Sigma I_{OH} $	—	—	40	mA

- Notes: 1. To protect chip reliability, do not exceed the output current values in table 22.13.
 2. When directly driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 22.4 and 22.5.

**Figure 22.4 Darlington Pair Drive Circuit (Example)**

Figure 22.5 Sample LED Circuit

22.2.3 AC Characteristics

Clock timing parameters are listed in table 22.14, control signal timing parameters in table 22.15, and bus timing parameters in table 22.16. Timing parameters of the on-chip supporting modules are listed in table 22.17.

Table 22.14 Clock Timing

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications), $T_a = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ (wide-range specifications)

Condition A: $V_{CC} = 3.0$ to 5.5 V, $AV_{CC} = 3.0$ to 5.5 V, $V_{REF} = 3.0$ to AV_{CC} , $V_{SS} = AV_{SS} = 0$ V, $f_{max} = 13$ MHz

Condition B: $V_{CC} = 5.0$ V \pm 10%, $AV_{CC} = 5.0$ V \pm 10%, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0$ V, $f_{max} = 20$ MHz

	—	—	± 2.0	—	—	± 1.5	LSB	4 M Ω resistive load

22.2.6 Flash Memory Characteristics

Table 22.20 shows the flash memory characteristics.

Table 22.20 Flash Memory Characteristics (1)

Conditions: $V_{CC} = 4.5$ to 5.5 V, $AV_{CC} = 4.5$ to 5.5 V, $V_{SS} = AV_{SS} = 0$ V

$T_a = 0$ to $+75^\circ\text{C}$ (Programming/erasing operating temperature range: regular specification)

$T_a = 0$ to $+85^\circ\text{C}$ (Programming/erasing operating temperature range: wide-range specification)

Item	Symbol	Min	Typ	Max	Unit	Test Condition
Programming time ^{*1 *2 *4}	t_P	—	10	200	ms/ 32 bytes	
Erase time ^{*1 *3 *5}	t_E	—	100	1200	ms/block	
Reprogramming count	N_{WEC}	—	—	100	Times	
Programming	Wait time after SWE bit setting ^{*1}	x	10	—	—	μs
	Wait time after PSU bit setting ^{*1}	y	50	—	—	μs
	Wait time after P bit setting ^{*1 *4}	z	150	—	500	μs
	Wait time after P bit clear ^{*1}	α	10	—	—	μs
	Wait time after PSU bit clear ^{*1}	β	10	—	—	μs
	Wait time after PV bit setting ^{*1}	γ	4	—	—	μs
	Wait time after H'FF dummy write ^{*1}	ε	2	—	—	μs
	Wait time after PV bit clear ^{*1}	η	4	—	—	μs
	Maximum programming count ^{*1 *4}	N	—	—	403	Times
Erase	Wait time after SWE bit setting ^{*1}	x	10	—	—	μs
	Wait time after ESU bit setting ^{*1}	y	200	—	—	μs
	Wait time after E bit setting ^{*1 *5}	z	5	—	10	ms
	Wait time after E bit clear ^{*1}	α	10	—	—	μs
	Wait time after ESU bit clear ^{*1}	β	10	—	—	μs
	Wait time after EV bit setting ^{*1}	γ	20	—	—	μs
	Wait time after H'FF dummy write ^{*1}	ε	2	—	—	μs
	Wait time after EV bit clear ^{*1}	η	5	—	—	μs
Maximum erase count ^{*1 *5}	N	120	—	240	Times	

Notes: 1. Make each time setting in accordance with the program/program-verify flowchart or erase/erase-verify flowchart.

2. Programming time per 32 bytes (Shows the total period for which the P-bit in the flash memory control register (FLMCR) is set. It does not include the programming verification time)
3. Block erase time (Shows the total period for which the E-bit in FLMCR is set. It does not include the erase verification time)
4. To specify the maximum programming time ($t_P(\max)$) in the 32-byte programming flowchart, set the maximum value (403) for the maximum programming count (N). The wait time after P bit setting (z) should be changed as follows according to the programming counter value.

Programming counter value of 1 to 4 : z = 150 μ s

Programming counter value of 5 to 403 : z = 500 μ s

5. For the maximum erase time ($t_E(\max)$), the following relationship applies between the wait time after E bit setting (z) and the maximum erase count (N):

$$t_E(\max) = \text{Wait time after E bit setting (z)} \times \text{maximum erase count (N)}$$

To set the maximum erase time, the values of z and N should be set so as to satisfy the above formula.

Examples: When z = 5 [ms], N = 240 times

When z = 10 [ms], N = 120 times

Table 22.20 Flash Memory Characteristics (2)

Conditions: $V_{CC} = 3.0$ to 3.6 V, $AV_{CC} = 3.0$ to 3.6 V, $V_{SS} = AV_{SS} = 0$ V

$T_a = 0$ to $+75^\circ\text{C}$ (Programming/erasing operating temperature range: regular specification)

$T_a = 0$ to $+85^\circ\text{C}$ (Programming/erasing operating temperature range: wide-range specification)

Item	Symbol	Min	Typ	Max	Unit	Test Condition
Programming time ^{*1 *2 *4}	t_P	—	10	200	ms/ 32 bytes	
Erase time ^{*1 *3 *5}	t_E	—	100	1200	ms/block	
Reprogramming count	N_{WEC}	—	—	100	Times	
Programming	Wait time after SWE bit setting ^{*1}	x	10	—	—	μs
	Wait time after PSU bit setting ^{*1}	y	50	—	—	μs
	Wait time after P bit setting ^{*1 *4}	z	150	—	500	μs
	Wait time after P bit clear ^{*1}	α	10	—	—	μs
	Wait time after PSU bit clear ^{*1}	β	10	—	—	μs
	Wait time after PV bit setting ^{*1}	γ	4	—	—	μs
	Wait time after H'FF dummy write ^{*1}	ε	2	—	—	μs
	Wait time after PV bit clear ^{*1}	η	4	—	—	μs
	Maximum programming count ^{*1 *4}	N	—	—	403	Times
Erase	Wait time after SWE bit setting ^{*1}	x	10	—	—	μs
	Wait time after ESU bit setting ^{*1}	y	200	—	—	μs
	Wait time after E bit setting ^{*1 *5}	z	5	—	10	ms
	Wait time after E bit clear ^{*1}	α	10	—	—	μs
	Wait time after ESU bit clear ^{*1}	β	10	—	—	μs
	Wait time after EV bit setting ^{*1}	γ	20	—	—	μs
	Wait time after H'FF dummy write ^{*1}	ε	2	—	—	μs
	Wait time after EV bit clear ^{*1}	η	5	—	—	μs
Maximum erase count ^{*1 *5}	N	120	—	240	Times	

- Notes: 1. Make each time setting in accordance with the program/program-verify flowchart or erase/erase-verify flowchart.
2. Programming time per 32 bytes (Shows the total period for which the P-bit in the flash memory control register (FLMCR) is set. It does not include the programming verification time)
3. Block erase time (Shows the total period for which the E-bit in FLMCR is set. It does not include the erase verification time)

4. To specify the maximum programming time ($t_P(\max)$) in the 32-byte programming flowchart, set the maximum value (403) for the maximum programming count (N). The wait time after P bit setting (z) should be changed as follows according to the programming counter value.

Programming counter value of 1 to 4 : z = 150 μ s

Programming counter value of 5 to 403 : z = 500 μ s

5. For the maximum erase time ($t_E(\max)$), the following relationship applies between the wait time after E bit setting (z) and the maximum erase count (N):

$$t_E(\max) = \text{Wait time after E bit setting (z)} \times \text{maximum erase count (N)}$$

To set the maximum erase time, the values of z and N should be set so as to satisfy the above formula.

Examples: When z = 5 [ms], N = 240 times

When z = 10 [ms], N = 120 times

22.3 Electrical Characteristics of H8/3064F-ZTAT B-Mask Version

22.3.1 Absolute Maximum Ratings

Table 22.21 lists the absolute maximum ratings.

Table 22.21 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}^{*1}	5 V operation model: -0.3 to +7.0	V
Input voltage (FWE) ^{*2}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (except for port 7) ^{*2}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (port 7)	V_{in}	-0.3 to $AV_{CC} + 0.3$	V
Reference voltage	V_{REF}	-0.3 to $AV_{CC} + 0.3$	V
Analog power supply voltage	AV_{CC}	5 V operation model: -0.3 to +7.0	V
Analog input voltage	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
Operating temperature	T_{opr}	Regular specifications: -20 to +75	°C
		Wide-range specifications: -40 to 85	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

Notes: The operating temperature range for flash memory programming/erasing is 0°C to +75°C.

1. Do not apply the power supply voltage to the V_{CL} pin in 5 V operation models. Connect an external capacitor between this pin and GND.
2. 12 V must not be applied to any pin, as this may cause permanent damage to the device.

22.3.2 DC Characteristics

Table 22.22 lists the DC characteristics. Table 22.23 lists the permissible output currents.

Table 22.22 DC Characteristics

Conditions: $V_{CC} = 5.0 \text{ V} \pm 10\%$, $AV_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{REF} = 4.5 \text{ V}$ to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS} = 0 \text{ V}^{*1}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to 85°C (wide-range specifications)
 [Programming/erasing conditions: $T_a = 0^\circ\text{C}$ to $+75^\circ\text{C}$]

Item	Symbol	Min	Typ	Max	Unit	Test Conditions

	NMI		—	—	50	pF	$f = f_{min}$		
	All input pins except NMI		—	—	15	pF	$T_a = 25^\circ\text{C}$		
Current dissipation*2	Normal operation	I_{CC}^{*3}	—	32 (5.0 V)	54	mA	$f = 20\text{ MHz}$		
					37 (5.0 V)		66	$f = 25\text{ MHz}$	
					Sleep mode		25 (5.0 V)	47	$f = 20\text{ MHz}$
							31 (5.0 V)	58	$f = 25\text{ MHz}$
					Module standby mode		21 (5.0 V)	33	$f = 20\text{ MHz}$
							24 (5.0 V)	40	$f = 25\text{ MHz}$
	Standby mode	1.0	10	μA	$T_a \leq 50^\circ\text{C}$				
		—	—	80	μA	$50^\circ\text{C} < T_a$			
		Flash memory programming/ erasing*4	42	64	mA	$f = 20\text{ MHz}$			
			47	76	mA	$f = 25\text{ MHz}$			
	Analog power supply current	During A/D conversion	I_{CC}	—	0.6	1.5	mA		
		During A/D and D/A conversion				1.5		mA	
Idle		0.01				5		μA	DASTE = 0

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Reference current	During A/D conversion	I_{CC}	—	0.45	0.8	mA	
	During A/D and D/A conversion		—	2.0	3.0	mA	
	Idle		—	0.01	5	μ A	DASTE = 0
RAM standby voltage		V_{RAM}	2.0	—	—	V	

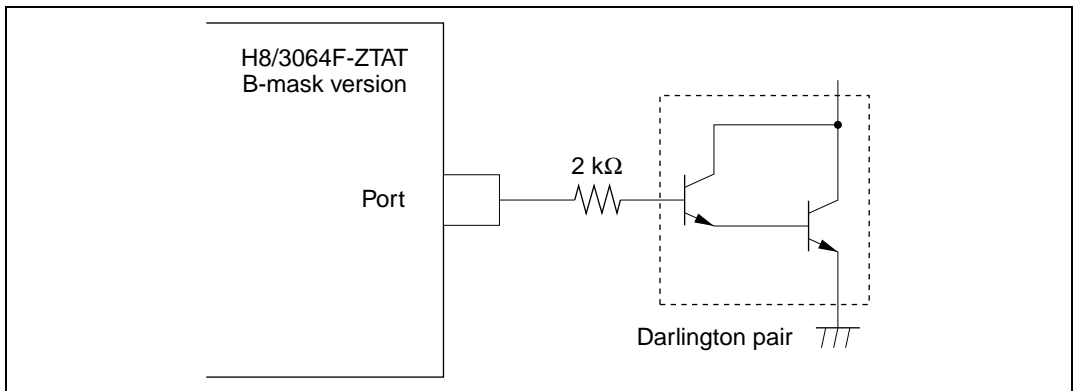

- Notes: 1. If the A/D converter is not used, do not leave the AV_{CC} , V_{REF} , and AV_{SS} pins open. Connect AV_{CC} and V_{REF} to V_{CC} , and connect AV_{SS} to V_{SS} .
2. Current dissipation values are for V_{IH} min = $V_{CC} - 0.5$ V and V_{IL} max = 0.5 V with all output pins unloaded and the on-chip MOS pull-up transistors in the off state. The values are for $V_{RAM} \leq V_{CC} < 4.5$ V, V_{IH} min = $V_{CC} \times 0.9$, and V_{IL} max = 0.3 V.
3. I_{CC} max (normal operation) = 3.0 (mA) + 0.46 (mA/(MHz \times V)) $\times V_{CC} \times f$
 I_{CC} max (sleep mode) = 3.0 (mA) + 0.40 (mA/(MHz \times V)) $\times V_{CC} \times f$
 I_{CC} max (sleep mode + module standby mode)
= 3.0 (mA) + 0.27 (mA/(MHz \times V)) $\times V_{CC} \times f$
- The Typ values for power consumption are reference values.
4. Sum of current dissipation in normal operation and current dissipation in program/erase operations.

Table 22.23 Permissible Output Currents

Conditions: $V_{CC} = 4.5\text{ V to }5.5\text{ V}$, $AV_{CC} = 4.5\text{ V to }5.5\text{ V}$, $V_{REF} = 4.5\text{ V to }AV_{CC}$,
 $V_{SS} = AV_{SS} = 0\text{ V}$, $T_a = -40^\circ\text{C to }+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C to }85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, and 5	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Total of 20 pins in Ports 1, 2, and 5	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	$ -I_{OH} $	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	$ \Sigma I_{OH} $	—	—	40	mA

- Notes: 1. To protect chip reliability, do not exceed the output current values in table 22.23.
2. When directly driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 22.7 and 22.8.

**Figure 22.7 Darlington Pair Drive Circuit (Example)**

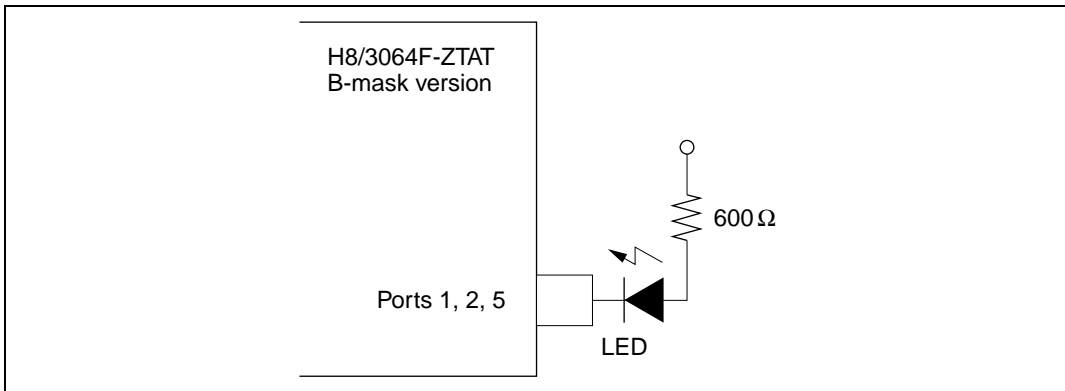

Figure 22.8 Sample LED Circuit

22.3.3 AC Characteristics

Clock timing parameters are listed in table 22.24, control signal timing parameters in table 22.25, and bus timing parameters in table 22.26. Timing parameters of the on-chip supporting modules are listed in table 22.27.

Table 22.24 Clock Timing

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Symbol	Condition				Unit	Test Conditions
		A		B			
		Min	Max	Min	Max		
Clock cycle time	t_{cyc}	50	500	40	500	ns	Figure 22.19 to figure 22.31

**Figure 22.9 Output Load Circuit**

22.3.4 A/D Conversion Characteristics

Table 22.28 lists the A/D conversion characteristics.

Table 22.28 A/D Conversion Characteristics

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item		Condition			Unit	
		Min	Typ	Max		
Conversion time: 134 states	Resolution	10	10	10	bits	
	Conversion time (single mode)	—	—	134	t_{cyc}	
	Analog input capacitance	—	—	20	pF	
	Permissible signal- source impedance	$\phi \leq 13\text{ MHz}$	—	—	10	$k\Omega$
		$\phi > 13\text{ MHz}$	—	—	5	$k\Omega$
		$4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$	—	—	—	$k\Omega$
		$3.0\text{ V} \leq AV_{CC} < 4.0\text{ V}$	—	—	—	$k\Omega$
	Nonlinearity error	—	—	± 3.5	LSB	
	Offset error	—	—	± 3.5	LSB	
	Full-scale error	—	—	± 3.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 4.0	LSB		
Conversion time: 70 states	Resolution	10	10	10	bits	
	Conversion time (single mode)	—	—	70	t_{cyc}	
	Analog input capacitance	—	—	20	pF	
	Permissible signal- source impedance	$\phi \leq 13\text{ MHz}$	—	—	5	$k\Omega$
		$\phi > 13\text{ MHz}$	—	—	3	$k\Omega$
		$4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$	—	—	—	$k\Omega$
		$3.0\text{ V} \leq AV_{CC} < 4.0\text{ V}$	—	—	—	$k\Omega$
	Nonlinearity error	—	—	± 7.5	LSB	
	Offset error	—	—	± 7.5	LSB	
	Full-scale error	—	—	± 7.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 8.0	LSB		

22.3.5 D/A Conversion Characteristics

Table 22.29 lists the D/A conversion characteristics.

Table 22.29 D/A Conversion Characteristics

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Condition			Unit	Test Conditions
	A and B				
	Min	Typ	Max		
Resolution	8	8	8	bits	
Conversion time (centering time)	—	—	10	μs	20 pF capacitive load
Absolute accuracy	—	± 1.5	± 2.0	LSB	2 M Ω resistive load
	—	—	± 1.5	LSB	4 M Ω resistive load

22.3.6 Flash Memory Characteristics

Table 22.30 shows the flash memory characteristics.

Table 22.30 Flash Memory Characteristics

Conditions: $V_{CC} = 4.5$ to 5.5 V, $AV_{CC} = 4.5$ to 5.5 V, $V_{SS} = AV_{SS} = 0$ V,
 $T_a = 0^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications), $T_a = -40^\circ\text{C}$ to 85°C (wide-range specifications) (operating temperature range for programming/erasing)

Item	Symbol	Min	Typ	Max	Unit	Notes	
Programming time ^{*1 *2 *4}	t_P	—	10	200	ms/ 128 bytes		
Erase time ^{*1 *3 *5}	t_E	—	100	1200	ms/block		
Reprogramming count	N_{WEC}	—	—	100	Times		
Programming	Wait time after SWE bit setting ^{*1}	t_{SSWE}	1	1	—	μs	
	Wait time after PSU bit setting ^{*1}	t_{SPSU}	50	50	—	μs	
	Wait time after P bit setting ^{*1 *4}	t_{SP30}	28	30	32	μs	Programming time wait
		t_{SP200}	198	200	202	μs	Programming time wait
		t_{SP10}	8	10	12	μs	Additional-programming time wait
	Wait time after P bit clear ^{*1}	t_{CP}	5	5	—	μs	
	Wait time after PSU bit clear ^{*1}	t_{CPSU}	5	5	—	μs	
	Wait time after PV bit setting ^{*1}	t_{SPV}	4	4	—	μs	
	Wait time after H'FF dummy write ^{*1}	t_{SPVR}	2	2	—	μs	
	Wait time after PV bit clear ^{*1}	t_{CPV}	2	2	—	μs	
Wait time after SWE bit clear ^{*1}	t_{CSWE}	100	100	—	μs		
Maximum programming count ^{*1 *4}	N	—	—	1000	Times		
Erase	Wait time after SWE bit setting ^{*1}	t_{SSWE}	1	1	—	μs	
	Wait time after ESU bit setting ^{*1}	t_{SESU}	100	100	—	μs	
	Wait time after E bit setting ^{*1 *5}	t_{SE}	10	10	100	ms	Erase time wait
	Wait time after E bit clear ^{*1}	t_{CE}	10	10	—	μs	
	Wait time after ESU bit clear ^{*1}	t_{CESU}	10	10	—	μs	
	Wait time after EV bit setting ^{*1}	t_{SEV}	20	20	—	μs	
	Wait time after H'FF dummy write ^{*1}	t_{SEVR}	2	2	—	μs	
	Wait time after EV bit clear ^{*1}	t_{CEV}	4	4	—	μs	
	Wait time after SWE bit clear ^{*1}	t_{CSWE}	100	100	—	μs	
	Maximum erase count ^{*1 *4}	N	12	—	120	Times	

- Notes:
1. Make each time setting in accordance with the program/program-verify flowchart or erase/erase-verify flowchart.
 2. Programming time per 128 bytes (Shows the total period for which the P-bit in the flash memory control register (FLMCR) is set. It does not include the programming verification time)
 3. Block erase time (Shows the total period for which the E-bit in FLMCR is set. It does not include the erase verification time)
 4. To specify the maximum programming time ($t_P(\max)$) in the 128-byte programming flowchart, set the maximum value (1000) for the maximum programming count (N).
The wait time after P bit setting should be changed as follows according to the value of the programming counter (n).

Programming counter (n) = 1 to 6 : $t_{sp30} = 30 \mu\text{s}$

Programming counter (n) = 7 to 1000 : $t_{sp200} = 200 \mu\text{s}$

Programming counter (n) [in additional programming] = 1 to 6: $t_{sp10} = 10 \mu\text{s}$

5. For the maximum erase time ($t_E(\max)$), the following relationship applies between the wait time after E bit setting (t_{se}) and the maximum erase count (N):

$$t_E(\max) = \text{Wait time after E bit setting } (t_{se}) \times \text{maximum erase count } (N)$$

To set the maximum erase time, the values of t_{se} and N should be set so as to satisfy the above formula.

Examples: When $t_{se} = 100 \text{ [ms]}$, N = 12 times

When $t_{se} = 10 \text{ [ms]}$, N = 120 times

22.4 Electrical Characteristics of H8/3064 Masked ROM B-Mask Version

22.4.1 Absolute Maximum Ratings

Table 22.31 lists the absolute maximum ratings.

Table 22.31 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}^{*1}	-0.3 to +7.0	V
Input voltage (except for port 7) ^{*2}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (port 7)	V_{in}	-0.3 to $AV_{CC} + 0.3$	V
Reference voltage	V_{REF}	-0.3 to $AV_{CC} + 0.3$	V
Analog power supply voltage	AV_{CC}	-0.3 to +7.0	V
Analog input voltage	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
Operating temperature	T_{opr}	Regular specifications: -20 to +75	°C
		Wide-range specifications: -40 to +85	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

- Notes: 1. Do not supply the power supply voltage to the V_{CL} pin. Connect an external capacitor between this pin and GND.
2. 12 V must not be applied to any pin, as this may cause permanent damage to the device.

22.4.2 DC Characteristics

Table 22.32 lists the DC characteristics. Table 22.33 lists the permissible output currents.

Table 22.32 DC Characteristics

Conditions: $V_{CC} = 5.0 \text{ V} \pm 10\%$, $AV_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{REF} = 4.5 \text{ V}$ to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS} = 0 \text{ V}^{*1}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to $+85^\circ\text{C}$ (wide-range specifications)

Item	Symbol	Min	Typ	Max	Unit	Test Conditions		
Schmitt trigger input voltages	Port A, P8 ₀ to P8 ₂	V_T^-	1.0	—	—	V

			—	37	66	mA	$f = 25\text{ MHz}$
	Sleep mode		—	25	47	mA	$f = 20\text{ MHz}$
			—	31	58	mA	$f = 25\text{ MHz}$
	Module standby mode		—	21	33	mA	$f = 20\text{ MHz}$
			—	24	40	mA	$f = 25\text{ MHz}$
	Standby mode		—	1.0	10	μA	$T_a \leq 50^\circ\text{C}$
			—	—	80	μA	$50^\circ\text{C} < T_a$
Analog power supply current	During A/D conversion	AI_{CC}	—	0.6	1.5	mA	
	During A/D and D/A conversion		—	0.6	1.5	mA	
	Idle		—	0.01	5.0	μA	DASTE = 0
Reference current	During A/D conversion	AI_{CC}	—	0.45	0.8	mA	
	During A/D and D/A conversion		—	2.0	3.0	mA	
	Idle		—	0.01	5.0	μA	DASTE = 0
RAM standby voltage		V_{RAM}	2.0	—	—	V	

Notes: 1. If the A/D converter is not used, do not leave the AV_{CC} , V_{REF} , and AV_{SS} pins open. Connect AV_{CC} and V_{REF} to V_{CC} , and connect AV_{SS} to V_{SS} .

2. Current dissipation values are for $V_{IH\ min} = V_{CC} - 0.5\text{ V}$ and $V_{IL\ max} = 0.5\text{ V}$ with all output pins unloaded and the on-chip MOS pull-up transistors in the off state. The values are for $V_{RAM} \leq V_{CC} < 4.5\text{ V}$, $V_{IH\ min} = V_{CC} \times 0.9$, and $V_{IL\ max} = 0.3\text{ V}$.

3. $I_{CC} \text{ max (normal operation)} = 3.0 \text{ (mA)} + 0.46 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$
 $I_{CC} \text{ max (sleep mode)} = 3.0 \text{ (mA)} + 0.40 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$
 $I_{CC} \text{ max (sleep mode + module standby mode)}$
 $= 3.0 \text{ (mA)} + 0.27 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$

The Typ values for power consumption are reference values.

Table 22.33 Permissible Output Currents

Conditions: $V_{CC} = 5.0 \text{ V} \pm 10\%$, $AV_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{REF} = 4.5 \text{ V to } AV_{CC}$,
 $V_{SS} = AV_{SS} = 0 \text{ V}$, $T_a = -20^\circ\text{C to } +75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C to } +85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, and 5	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Total of 20 pins in Ports 1, 2, and 5	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	$ I_{OH} $	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	$ \Sigma I_{OH} $	—	—	40	mA

- Notes: 1. To protect chip reliability, do not exceed the output current values in table 22.33.
2. When directly driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 22.10 and 22.11.

**Figure 22.10 Darlington Pair Drive Circuit (Example)****Figure 22.11 Sample LED Circuit**

22.4.3 AC Characteristics

Clock timing parameters are listed in table 22.34, control signal timing parameters in table 22.35, and bus timing parameters in table 22.36. Timing parameters of the on-chip supporting modules are listed in table 22.37.

Table 22.34 Clock Timing

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Symbol	Condition				Unit	Test Conditions

22.4.4 A/D Conversion Characteristics

Table 22.38 lists the A/D conversion characteristics.

Table 22.38 A/D Conversion Characteristics

Condition: $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item		Condition			Unit	
		A and B				
		Min	Typ	Max		
Conversion time: 134 states	Resolution	10	10	10	bits	
	Conversion time (single mode)	5.36	—	—	μs	
	Analog input capacitance	—	—	20	pF	
	Permissible signal- source impedance	$\phi \leq 13\text{ MHz}$	—	—	10	k Ω
		$\phi > 13\text{ MHz}$	—	—	5	k Ω
	Nonlinearity error	—	—	± 3.5	LSB	
	Offset error	—	—	± 3.5	LSB	
	Full-scale error	—	—	± 3.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 4.0	LSB		
Conversion time: 70 states*	Resolution	10	10	10	bits	
	Conversion time (single mode)	5.36	—	—	μs	
	Analog input capacitance	—	—	20	pF	
	Permissible signal- source impedance	$\phi \leq 13\text{ MHz}$	—	—	5	k Ω
		$\phi > 13\text{ MHz}$	—	—	3	k Ω
	Nonlinearity error	—	—	± 7.5	LSB	
	Offset error	—	—	± 7.5	LSB	
	Full-scale error	—	—	± 7.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 8.0	LSB		

Note: * When using an operating frequency f (MHz) exceeding $70/5.36 = 13$ (MHz), do not select 70 states for the conversion time.

22.4.5 D/A Conversion Characteristics

Table 22.39 lists the D/A conversion characteristics.

Table 22.39 D/A Conversion Characteristics

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Condition			Unit	Test Conditions
	Min	Typ	Max		
Resolution	8	8	8	bits	
Conversion time (centering time)	—	—	10	μs	20 pF capacitive load

	—	—	± 1.5	LSB	4 M Ω resistive load

22.5 Electrical Characteristics of H8/3062F-ZTAT B-Mask Version

22.5.1 Absolute Maximum Ratings

Table 22.40 lists the absolute maximum ratings.

Table 22.40 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}^{*1}	5 V operation model: -0.3 to +7.0	V
Input voltage (FWE) ^{*2}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (except for port 7) ^{*2}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (port 7)	V_{in}	-0.3 to $AV_{CC} + 0.3$	V
Reference voltage	V_{REF}	-0.3 to $AV_{CC} + 0.3$	V
Analog power supply voltage	AV_{CC}	5 V operation model: -0.3 to +7.0	V
Analog input voltage	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
Operating temperature	T_{opr}	Regular specifications: -20 to +75	°C
		Wide range specifications: -40 to 85	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

Notes: The operating temperature range for flash memory programming/erasing is 0°C to +75°C.

1. Do not apply the power supply voltage to the V_{CL} pin in 5 V operation models. Connect an external capacitor between this pin and GND.
2. 12 V must not be applied to any pin, as this may cause permanent damage to the device.

22.5.2 DC Characteristics

Table 22.41 lists the DC characteristics. Table 22.42 lists the permissible output currents.

Table 22.41 DC Characteristics

Conditions: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5\text{ V}$ to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS}^{*1} = 0\text{ V}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to 85°C (wide-range specifications)
 [Programming/erasing conditions: $T_a = 0^\circ\text{C}$ to $+75^\circ\text{C}$]

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Schmitt trigger input voltages	Port A,	V_T^-	1.0	—	—	V	
	P8 ₀ to P8 ₂	V_T^+	—	—	$V_{CC} \times 0.7$	V	
		$V_T^+ - V_T^-$	0.4	—	—	V

Current dissipation*2	Normal operation	I_{CC}^{*3}	—	32	47	mA	$f = 20 \text{ MHz}$		
				(5.0 V)	37		58	$f = 25 \text{ MHz}$	
	Sleep mode		—	24	38	mA	$f = 20 \text{ MHz}$		
			(5.0 V)	29	47		$f = 25 \text{ MHz}$		
	Module standby mode		—	19	31	mA	$f = 20 \text{ MHz}$		
			(5.0 V)	21	37		$f = 25 \text{ MHz}$		
	Standby mode		—	1.0	10	μA	$T_a \leq 50^\circ\text{C}$		
			—	—	80		$50^\circ\text{C} < T_a$		
	Flash memory programming/erasing*4		—	37	57	mA	$f = 20 \text{ MHz}$		
				42	68		$f = 25 \text{ MHz}$		
	Analog power supply current		During A/D conversion	AI_{CC}	—	0.6	1.5	mA	
			During A/D and D/A conversion			0.6	1.5		mA
Idle		0.01	5			μA	DASTE = 0		

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Reference current	During A/D conversion	I_{CC}	—	0.45	0.8	mA	
	During A/D and D/A conversion		—	2.0	3.0	mA	
	Idle		—	0.01	5	μ A	DASTE = 0
RAM standby voltage		V_{RAM}	2.0	—	—	V	

- Notes:
- If the A/D converter is not used, do not leave the AV_{CC} , V_{REF} , and AV_{SS} pins open. Connect AV_{CC} and V_{REF} to V_{CC} , and connect AV_{SS} to V_{SS} .
 - Current dissipation values are for V_{IH} min = $V_{CC} - 0.5$ V and V_{IL} max = 0.5 V with all output pins unloaded and the on-chip MOS pull-up transistors in the off state. The values are for $V_{RAM} \leq V_{CC} < 4.5$ V, V_{IH} min = $V_{CC} \times 0.9$, and V_{IL} max = 0.3 V.
 - I_{CC} max (normal operation) = 3.0 (mA) + 0.40 (mA/(MHz \times V)) \times $V_{CC} \times f$
 I_{CC} max (sleep mode) = 3.0 (mA) + 0.32 (mA/(MHz \times V)) \times $V_{CC} \times f$
 I_{CC} max (sleep mode + module standby mode)
= 3.0 (mA) + 0.25 (mA/(MHz \times V)) \times $V_{CC} \times f$
The Typ values for power consumption are reference values.
 - Sum of current dissipation in normal operation and current dissipation in program/erase operations.

Table 22.42 Permissible Output Currents

Conditions: $V_{CC} = 4.5\text{ V to }5.5\text{ V}$, $AV_{CC} = 4.5\text{ V to }5.5\text{ V}$, $V_{REF} = 4.5\text{ V to }AV_{CC}$,
 $V_{SS} = AV_{SS} = 0\text{ V}$, $T_a = -40^\circ\text{C to }+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C to }85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, and 5	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Total of 20 pins in Ports 1, 2, and 5	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	$ -I_{OH} $	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	$ \Sigma I_{OH} $	—	—	40	mA

- Notes: 1. To protect chip reliability, do not exceed the output current values in table 22.42.
2. When directly driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 22.13 and 22.14.

Figure 22.13 Darlington Pair Drive Circuit (Example)

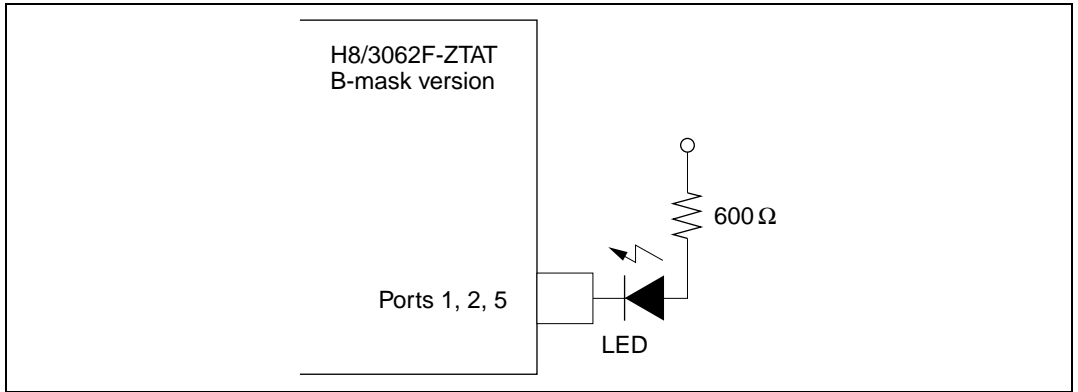

Figure 22.14 Sample LED Circuit

22.5.3 AC Characteristics

Clock timing parameters are listed in table 22.43, control signal timing parameters in table 22.44, and bus timing parameters in table 22.45. Timing parameters of the on-chip supporting modules are listed in table 22.46.

Table 22.43 Clock Timing

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Symbol	Condition				Unit	Test Conditions
		A		B			
		Min	Max	Min	Max		
Clock cycle time	t_{cyc}	50	500	40	500	ns	Figure 22.19 to figure 22.31

22.5.4 A/D Conversion Characteristics

Table 22.47 lists the A/D conversion characteristics.

Table 22.47 A/D Conversion Characteristics

Condition: $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item		Condition			Unit	
		Min	Typ	Max		
Conversion time: 134 states	Resolution	10	10	10	bits	
	Conversion time (single mode)	—	—	134	t_{cyc}	
	Analog input capacitance	—	—	20	pF	
	Permissible signal-source impedance	$\phi \leq 13\text{ MHz}$	—	—	10	k Ω
		$\phi > 13\text{ MHz}$	—	—	5	k Ω
		$4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$	—	—	—	k Ω
		$3.0\text{ V} \leq AV_{CC} < 4.0\text{ V}$	—	—	—	k Ω
	Nonlinearity error	—	—	± 3.5	LSB	
	Offset error	—	—	± 3.5	LSB	
	Full-scale error	—	—	± 3.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 4.0	LSB		
Conversion time: 70 states	Resolution	10	10	10	bits	
	Conversion time (single mode)	—	—	70	t_{cyc}	
	Analog input capacitance	—	—	20	pF	
	Permissible signal-source impedance	$\phi \leq 13\text{ MHz}$	—	—	5	k Ω
		$\phi > 13\text{ MHz}$	—	—	3	k Ω
		$4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$	—	—	—	k Ω
		$3.0\text{ V} \leq AV_{CC} < 4.0\text{ V}$	—	—	—	k Ω
	Nonlinearity error	—	—	± 7.5	LSB	
	Offset error	—	—	± 7.5	LSB	
	Full-scale error	—	—	± 7.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 8.0	LSB		

22.5.5 D/A Conversion Characteristics

Table 22.48 lists the D/A conversion characteristics.

Table 22.48 D/A Conversion Characteristics

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Condition			Unit	Test Conditions
	A and B				
	Min	Typ	Max		
Resolution	8	8	8	bits	
Conversion time (centering time)	—	—	10	μs	20 pF capacitive load
Absolute accuracy	—	± 1.5	± 2.0	LSB	2 M Ω resistive load
	—	—	± 1.5	LSB	4 M Ω resistive load

22.5.6 Flash Memory Characteristics

Table 22.49 shows the flash memory characteristics.

Table 22.49 Flash Memory Characteristics

Conditions: $V_{CC} = 4.5$ to 5.5 V, $AV_{CC} = 4.5$ to 5.5 V, $V_{SS} = AV_{SS} = 0$ V,
 $T_a = 0^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications), $T_a = -40^\circ\text{C}$ to 85°C (wide-range specifications) (operating temperature range for programming/erasing)

Item	Symbol	Min	Typ	Max	Unit	Notes	
Programming time ^{*1 *2 *4}	t_P	—	10	200	ms/ 128 bytes		
Erase time ^{*1 *3 *5}	t_E	—	100	1200	ms/block		
Reprogramming count	N_{WEC}	—	—	100	Times		
Programming	Wait time after SWE bit setting ^{*1}	t_{SSWE}	1	1	—	μs	
	Wait time after PSU bit setting ^{*1}	t_{SPSU}	50	50	—	μs	
	Wait time after P bit setting ^{*1 *4}	t_{SP30}	28	30	32	μs	Programming time wait
		t_{SP200}	198	200	202	μs	Programming time wait
		t_{SP10}	8	10	12	μs	Additional-programming time wait
	Wait time after P bit clear ^{*1}	t_{CP}	5	5	—	μs	
	Wait time after PSU bit clear ^{*1}	t_{CPSU}	5	5	—	μs	
	Wait time after PV bit setting ^{*1}	t_{SPV}	4	4	—	μs	
	Wait time after H'FF dummy write ^{*1}	t_{SPVR}	2	2	—	μs	
	Wait time after PV bit clear ^{*1}	t_{CPV}	2	2	—	μs	
	Wait time after SWE bit clear ^{*1}	t_{CSWE}	100	100	—	μs	
	Maximum programming count ^{*1 *4}	N	—	—	1000	Times	
	Erase	Wait time after SWE bit setting ^{*1}	t_{SSWE}	1	1	—	μs
Wait time after ESU bit setting ^{*1}		t_{SESU}	100	100	—	μs	
Wait time after E bit setting ^{*1 *5}		t_{SE}	10	10	100	ms	Erase time wait
Wait time after E bit clear ^{*1}		t_{CE}	10	10	—	μs	
Wait time after ESU bit clear ^{*1}		t_{CESU}	10	10	—	μs	
Wait time after EV bit setting ^{*1}		t_{SEV}	20	20	—	μs	
Wait time after H'FF dummy write ^{*1}		t_{SEVR}	2	2	—	μs	
Wait time after EV bit clear ^{*1}		t_{CEV}	4	4	—	μs	
Wait time after SWE bit clear ^{*1}		t_{CSWE}	100	100	—	μs	
Maximum erase count ^{*1 *5}		N	12	—	120	Times	

- Notes:
1. Make each time setting in accordance with the program/program-verify flowchart or erase/erase-verify flowchart.
 2. Programming time per 128 bytes (Shows the total period for which the P-bit in the flash memory control register (FLMCR1) is set. It does not include the programming verification time)
 3. Block erase time (Shows the total period for which the E-bit in FLMCR1 is set. It does not include the erase verification time)
 4. To specify the maximum programming time ($t_P(\max)$) in the 128-byte programming flowchart, set the maximum value (1000) for the maximum programming count (N).
The wait time after P bit setting should be changed as follows according to the value of the programming counter (n).

Programming counter (n) = 1 to 6 : $t_{sp30} = 30 \mu\text{s}$

Programming counter (n) = 7 to 1000 : $t_{sp200} = 200 \mu\text{s}$

Programming counter (n) [in additional programming] = 1 to 6: $t_{sp10} = 10 \mu\text{s}$

5. For the maximum erase time ($t_E(\max)$), the following relationship applies between the wait time after E bit setting (t_{se}) and the maximum erase count (N):

$$t_E(\max) = \text{Wait time after E bit setting } (t_{se}) \times \text{maximum erase count } (N)$$

To set the maximum erase time, the values of t_{se} and N should be set so as to satisfy the above formula.

Examples: When $t_{se} = 100 \text{ [ms]}$, N = 12 times

When $t_{se} = 10 \text{ [ms]}$, N = 120 times

22.6 Electrical Characteristics of H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, and H8/3060 Masked ROM B-Mask Version

22.6.1 Absolute Maximum Ratings

Table 22.50 lists the absolute maximum ratings.

Table 22.50 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}^{*1}	-0.3 to +7.0	V
Input voltage (except for port 7) ^{*2}	V_{in}	-0.3 to $V_{CC} + 0.3$	V
Input voltage (port 7)	V_{in}	-0.3 to $AV_{CC} + 0.3$	V
Reference voltage	V_{REF}	-0.3 to $AV_{CC} + 0.3$	V
Analog power supply voltage	AV_{CC}	-0.3 to +7.0	V
Analog input voltage	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
Operating temperature	T_{opr}	Regular specifications: -20 to +75	°C
		Wide-range specifications: -40 to +85	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

- Notes: 1. Do not supply the power supply voltage to the V_{CL} pin in 5 V operation models. Connect an external capacitor between this pin and GND.
2. 12 V must not be applied to any pin, as this may cause permanent damage to the device.

22.6.2 DC Characteristics

Table 22.51 lists the DC characteristics. Table 22.52 lists the permissible output currents.

Table 22.51 DC Characteristics

Conditions: $V_{CC} = 5.0 \text{ V} \pm 10\%$, $AV_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{REF} = 4.5 \text{ V}$ to AV_{CC}^{*1} ,
 $V_{SS} = AV_{SS} = 0 \text{ V}^{*1}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to $+85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit	Test Conditions	
Schmitt trigger input voltages	Port A, P8 ₀ to P8 ₂	V_{T^-}	1.0	—	—	V		
		V_{T^+}	—	—	$V_{CC} \times 0.7$	V		
		$V_{T^+} - V_{T^-}$	0.4	—	—	V

Input capacitance	NMI	C_{in}	—	—	50	pF $f = f_{min}$, $T_a = 25^\circ\text{C}$	
	All input pins except NMI	—	—	—	15	pF	
Current dissipation*2	Normal operation	I_{CC}^{*3}	—	32	47	mA	$f = 20\text{ MHz}$
			—	37	58	mA	$f = 25\text{ MHz}$
	Sleep mode	—	—	24	38	mA	$f = 20\text{ MHz}$
			—	29	47	mA	$f = 25\text{ MHz}$
	Module standby mode	—	—	19	31	mA	$f = 20\text{ MHz}$
			—	21	37	mA	$f = 25\text{ MHz}$
	Standby mode	—	—	1.0	10	μA	$T_a \leq 50^\circ\text{C}$
			—	—	80	μA	$50^\circ\text{C} < T_a$
	Analog power supply current	During A/D conversion	AI_{CC}	—	0.6	1.5	mA
		During A/D and D/A conversion	—	—	0.6	1.5	mA
Idle		—	—	0.01	5.0	μA DASTE = 0	
Reference current	During A/D conversion	AI_{CC}	—	0.45	0.8	mA	
	During A/D and D/A conversion	—	—	2.0	3.0	mA	
	Idle	—	—	0.01	5.0	μA DASTE = 0	
RAM standby voltage	V_{RAM}	2.0	—	—	V		

- Notes: 1. If the A/D converter is not used, do not leave the AV_{CC} , V_{REF} , and AV_{SS} pins open. Connect AV_{CC} and V_{REF} to V_{CC} , and connect AV_{SS} to V_{SS} .
2. Current dissipation values are for $V_{IH\ min} = V_{CC} - 0.5\text{ V}$ and $V_{IL\ max} = 0.5\text{ V}$ with all output pins unloaded and the on-chip MOS pull-up transistors in the off state. The values are for $V_{RAM} \leq V_{CC} < 4.5\text{ V}$, $V_{IH\ min} = V_{CC} \times 0.9$, and $V_{IL\ max} = 0.3\text{ V}$.

3. $I_{CC} \text{ max (normal operation)} = 3.0 \text{ (mA)} + 0.46 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$
 $I_{CC} \text{ max (sleep mode)} = 3.0 \text{ (mA)} + 0.40 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$
 $I_{CC} \text{ max (sleep mode + module standby mode)}$
 $= 3.0 \text{ (mA)} + 0.27 \text{ (mA/(MHz} \times \text{V))} \times V_{CC} \times f$

The Typ values for power consumption are reference values.

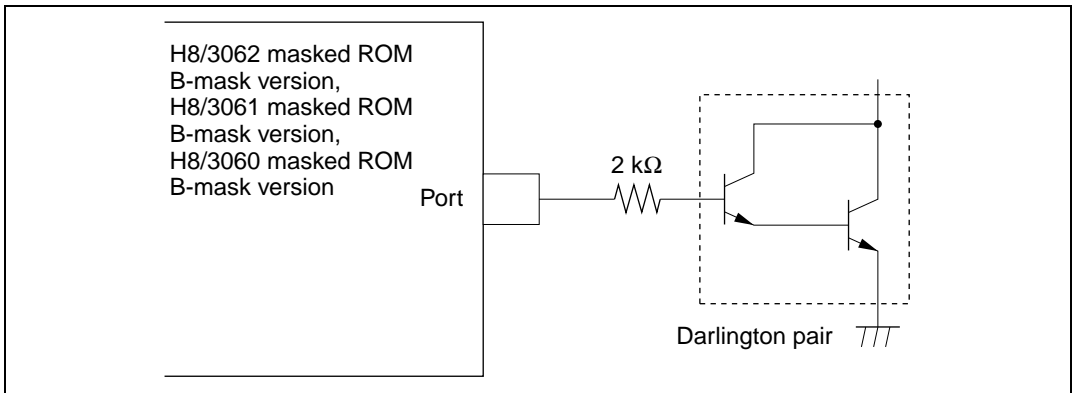

Table 22.52 Permissible Output Currents

Conditions: $V_{CC} = 5.0 \text{ V} \pm 10\%$, $AV_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{REF} = 4.5 \text{ V}$ to AV_{CC} ,
 $V_{SS} = AV_{SS} = 0 \text{ V}$, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$ (regular specifications),
 $T_a = -40^\circ\text{C}$ to $+85^\circ\text{C}$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, and 5	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Total of 20 pins in Ports 1, 2, and 5	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	$ I_{OH} $	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	$ \Sigma I_{OH} $	—	—	40	mA

Notes: 1. To protect chip reliability, do not exceed the output current values in table 22.52.

2. When directly driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 22.16 and 22.17.

**Figure 22.16 Darlington Pair Drive Circuit (Example)****Figure 22.17 Sample LED Circuit**

22.6.3 AC Characteristics

Clock timing parameters are listed in table 22.53, control signal timing parameters in table 22.54, and bus timing parameters in table 22.55. Timing parameters of the on-chip supporting modules are listed in table 22.56.

Table 22.53 Clock Timing

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Symbol	Condition				Unit	Test Conditions
		A		B			
		Min	Max	Min	Max

22.6.4 A/D Conversion Characteristics

Table 22.57 lists the A/D conversion characteristics.

Table 22.57 A/D Conversion Characteristics

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item		Condition			Unit	
		Min	Typ	Max		
Conversion time: 134 states	Resolution	10	10	10	bits	
	Conversion time (single mode)	5.36	—	—	μs	
	Analog input capacitance	—	—	20	pF	
	Permissible signal- source impedance	$\phi \leq 13\text{ MHz}$	—	—	10	$\text{k}\Omega$
		$\phi > 13\text{ MHz}$	—	—	5	$\text{k}\Omega$
		$4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$	—	—	—	$\text{k}\Omega$
		$3.0\text{ V} \leq AV_{CC} < 4.0\text{ V}$	—	—	—	$\text{k}\Omega$
	Nonlinearity error	—	—	± 3.5	LSB	
	Offset error	—	—	± 3.5	LSB	
	Full-scale error	—	—	± 3.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 4.0	LSB		
Conversion time: 70 states*	Resolution	10	10	10	bits	
	Conversion time (single mode)	5.36	—	—	μs	
	Analog input capacitance	—	—	20	pF	
	Permissible signal- source impedance	$\phi \leq 13\text{ MHz}$	—	—	5	$\text{k}\Omega$
		$\phi > 13\text{ MHz}$	—	—	3	$\text{k}\Omega$
		$4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$	—	—	—	$\text{k}\Omega$
		$3.0\text{ V} \leq AV_{CC} < 4.0\text{ V}$	—	—	—	$\text{k}\Omega$
	Nonlinearity error	—	—	± 7.5	LSB	
	Offset error	—	—	± 7.5	LSB	
	Full-scale error	—	—	± 7.5	LSB	
	Quantization error	—	—	± 0.5	LSB	
Absolute accuracy	—	—	± 8.0	LSB		

Note: * When using an operating frequency f (MHz) exceeding $70/5.36 = 13$ (MHz), do not select 70 states for the conversion time.

22.6.5 D/A Conversion Characteristics

Table 22.58 lists the D/A conversion characteristics.

Table 22.58 D/A Conversion Characteristics

Condition: $T_a = -20^{\circ}\text{C}$ to $+75^{\circ}\text{C}$ (regular specifications),
 $T_a = -40^{\circ}\text{C}$ to 85°C (wide-range specifications)

Condition A: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 20\text{ MHz}$

Condition B: $V_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{CC} = 5.0\text{ V} \pm 10\%$, $V_{REF} = 4.5$ to AV_{CC} , $V_{SS} = AV_{SS} = 0\text{ V}$,
 $f_{max} = 25\text{ MHz}$

Item	Condition			Unit	Test Conditions
	A and B				
	Min	Typ	Max		
Resolution	8	8	8	bits	
Conversion time (centering time)	—	—	10	μs	20 pF capacitive load
Absolute accuracy	—	± 1.5	± 2.0	LSB	2 M Ω resistive load
	—	—	± 1.5	LSB	4 M Ω resistive load

22.7 Operational Timing

This section shows timing diagrams.

22.7.1 Clock Timing

Clock timing is shown as follows:

- Oscillator settling timing

Figure 22.19 shows the oscillator settling timing.

Figure 22.19 Oscillator Settling Timing

22.7.2 Control Signal Timing

Control signal timing is shown as follows:

- Reset input timing
Figure 22.20 shows the reset input timing.
- Reset output timing*
Figure 22.21 shows the reset output timing.
- Interrupt input timing
Figure 22.22 shows the interrupt input timing for $\overline{\text{NMI}}$ and $\overline{\text{IRQ}}_5$ to $\overline{\text{IRQ}}_0$.

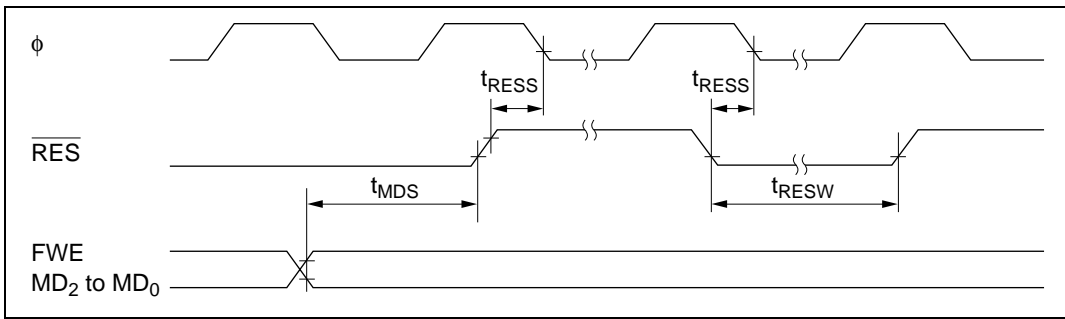

Figure 22.20 Reset Input Timing

Figure 22.21 Reset Output Timing*

Note: * This function is used only in masked ROM models, and is not provided in flash memory models.

Figure 22.22 Interrupt Input Timing

22.7.3 Bus Timing

Bus timing is shown as follows:

- Basic bus cycle: two-state access
Figure 22.23 shows the timing of the external two-state access cycle.
- Basic bus cycle: three-state access
Figure 22.24 shows the timing of the external three-state access cycle.
- Basic bus cycle: three-state access with one wait state
Figure 22.25 shows the timing of the external three-state access cycle with one wait state inserted.
- Bus-release mode timing
Figure 22.26 shows the bus-release mode timing.

Figure 22.23 Basic Bus Cycle: Two-State Access

Figure 22.24 Basic Bus Cycle: Three-State Access

Figure 22.25 Basic Bus Cycle: Three-State Access with One Wait State

Figure 22.26 Bus-Release Mode Timing

22.7.4 TPC and I/O Port Timing

Figure 22.27 shows the TPC and I/O port input/output timing.

Figure 22.27 TPC and I/O Port Input/Output Timing

22.7.5 Timer Input/Output Timing

16-bit timer and 8-bit timer timing is shown below.

- Timer input/output timing

Figure 22.28 shows the timer input/output timing.

- Timer external clock input timing

Figure 22.29 shows the timer external clock input timing.

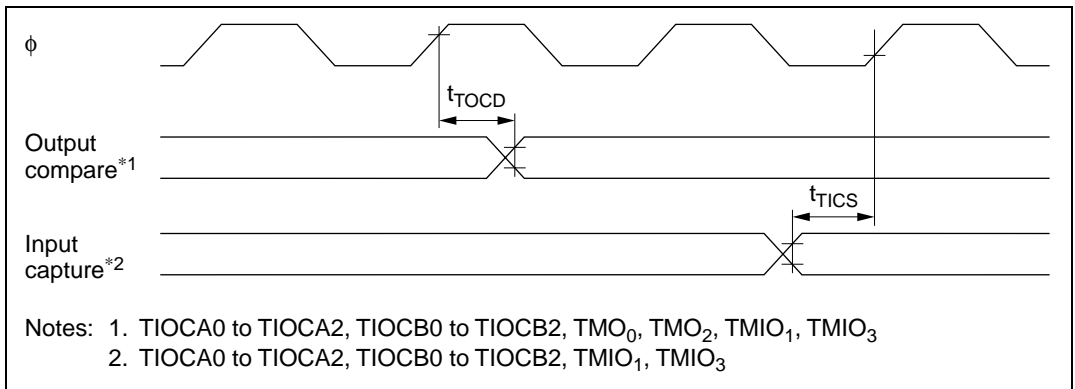

Figure 22.28 Timer Input/Output Timing

Figure 22.29 Timer External Clock Input Timing

22.7.6 SCI Input/Output Timing

SCI timing is shown as follows:

- SCI input clock timing
Figure 22.30 shows the SCI input clock timing.
- SCI input/output timing (synchronous mode)
Figure 22.31 shows the SCI input/output timing in synchronous mode.

Figure 22.30 SCI Input Clock Timing

Figure 22.31 SCI Input/Output Timing in Synchronous Mode

Appendix A Instruction Set

A.1 Instruction List

Operand Notation

Symbol	Description
Rd	General destination register
Rs	General source register
Rn	General register
ERd	General destination register (address register or 32-bit register)
ERs	General source register (address register or 32-bit register)
ERn	General register (32-bit register)
(EAd)	Destination operand
(EAs)	Source operand
PC	Program counter
SP	Stack pointer
CCR	Condition code register
N	N (negative) flag in CCR
Z	Z (zero) flag in CCR
V	V (overflow) flag in CCR
C	C (carry) flag in CCR
disp	Displacement
→	Transfer from the operand on the left to the operand on the right, or transition from the state on the left to the state on the right
+	Addition of the operands on both sides
–	Subtraction of the operand on the right from the operand on the left
×	Multiplication of the operands on both sides
÷	Division of the operand on the left by the operand on the right
^	Logical AND of the operands on both sides
∨	Logical OR of the operands on both sides
⊕	Exclusive logical OR of the operands on both sides
¬	NOT (logical complement)
(), < >	Contents of operand

Note: General registers include 8-bit registers (R0H to R7H and R0L to R7L) and 16-bit registers (R0 to R7 and E0 to E7).

Condition Code Notation

Symbol	Description
↕	Changed according to execution result
*	Undetermined (no guaranteed value)
0	Cleared to 0
1	Set to 1
—	Not affected by execution of the instruction
Δ	Varies depending on conditions, described in notes

- Notes: 1. The number of states is the number of states required for execution when the instruction and its operands are located in on-chip memory. For other cases see appendix A.3, Number of States Required for Execution.
2. n is the value set in register R4L or R4.
- (1) Set to 1 when a carry or borrow occurs at bit 11; otherwise cleared to 0.
 - (2) Set to 1 when a carry or borrow occurs at bit 27; otherwise cleared to 0.
 - (3) Retains its previous value when the result is zero; otherwise cleared to 0.
 - (4) Set to 1 when the adjustment produces a carry; otherwise retains its previous value.
 - (5) The number of states required for execution of an instruction that transfers data in synchronization with the E clock is variable.
 - (6) Set to 1 when the divisor is negative; otherwise cleared to 0.
 - (7) Set to 1 when the divisor is zero; otherwise cleared to 0.
 - (8) Set to 1 when the quotient is negative; otherwise cleared to 0.

Notes: 1. r is the register designation field.
 2. aa is the absolute address field.

A.3 Number of States Required for Execution

The tables in this section can be used to calculate the number of states required for instruction execution by the H8/300H CPU. Table A.4 indicates the number of instruction fetch, data read/write, and other cycles occurring in each instruction. Table A.3 indicates the number of states required per cycle according to the bus size. The number of states required for execution of an instruction can be calculated from these two tables as follows:

$$\text{Number of states} = I \times S_I + J \times S_J + K \times S_K + L \times S_L + M \times S_M + N \times S_N$$

Examples of Calculation of Number of States Required for Execution

Examples: Advanced mode, stack located in external address space, on-chip supporting modules accessed with 8-bit bus width, external devices accessed in three states with one wait state and 16-bit bus width.

BSET #0, @FFFFC7:8

From table A.4, $I = L = 2$ and $J = K = M = N = 0$

From table A.3, $S_I = 4$ and $S_L = 3$

Number of states = $2 \times 4 + 2 \times 3 = 14$

JSR @@30

From table A.4, $I = J = K = 2$ and $L = M = N = 0$

From table A.3, $S_I = S_J = S_K = 4$

Number of states = $2 \times 4 + 2 \times 4 + 2 \times 4 = 24$

Table A.3 Number of States per Cycle

Cycle		Access Conditions						
		On-Chip Memory	On-Chip Supporting Module		External Device			
					8-Bit Bus		16-Bit Bus	
			8-Bit Bus	16-Bit Bus	2-State Access	3-State Access	2-State Access	3-State Access
Instruction fetch	S_I	2	6	3	4	$6 + 2m$	2	$3 + m$
Branch address read	S_J							
Stack operation	S_K							
Byte data access	S_L		3		2	$3 + m$		
Word data access	S_M		6		4	$6 + 2m$		
Internal operation	S_N	1						

Legend:

m : Number of wait states inserted into external device access

Table A.4 Number of Cycles per Instruction

- Notes:
1. n is the value set in register R4L or R4. The source and destination are accessed n + 1 times each.
 2. Not available in the H8/3062 Group.

Appendix B Internal I/O Registers

Table B.1 Comparison of H8/3062 Group Internal I/O Register Specifications

Address (Low)	H8/3062 F-ZTAT R-Mask Version	H8/3062 Masked ROM Version, H8/3061 Masked ROM Version, H8/3060 Masked ROM Version	H8/3064 F-ZTAT B-Mask Version	H8/3062 F-ZTAT B-Mask Version	H8/3064 Masked ROM B-Mask Version, H8/3062 Masked ROM B-Mask Version, H8/3061 Masked ROM B-Mask Version, H8/3060 Masked ROM B-Mask Version	Module
H'EE01E	ADRCR	ADRCR	ADRCR	ADRCR	ADRCR	Bus controller

- Notes:
1. The address depends on the output trigger setting.
 2. Writing to bits 5 to 3 of BCR is prohibited.
 3. The FLMCR and EBR registers are used only in the versions with on-chip flash memory. Use byte access on these registers. FLMCR and EBR are not present in the versions with on-chip masked ROM.
 4. The RAMCR and FLMSR registers are used only in the versions with on-chip flash memory. Use byte access on these registers. RAMCR and FLMSR are not present in the versions with on-chip masked ROM.
 5. For the procedure for writing to TCSR, TCNT, and RSTCSR, see section 11.2.4, Notes on Register Rewriting.

Legend:

WDT : Watchdog timer

TPC : Programmable timing pattern controller

SCI : Serial communication interface

- Notes:
1. Writing to bits 6 to 0 of FLMCR2 is prohibited.
 2. Writing to bits 5 to 3 of BCR is prohibited.
 3. For the procedure for writing to TCSR, TCNT, and RSTCSR, see section 11.2.4, Notes on Register Rewriting.
 4. The address depends on the output trigger setting.
 5. Use byte access on FLMCR1, FLMCR2, EBR1, EBR2, and RAMCR.

Legend:

WDT : Watchdog timer

TPC : Programmable timing pattern controller

SCI : Serial communication interface

- Notes:
1. Writing to bits 6 to 0 of FLMCR2 is prohibited.
 2. Writing to bits 5 to 3 of BCR is prohibited.
 3. For the procedure for writing to TCSR, TCNT, and RSTCSR, see section 11.2.4, Notes on Register Rewriting.
 4. The address depends on the output trigger setting.
 5. Use byte access on FLMCR1, FLMCR2, EBR, and RAMCR.

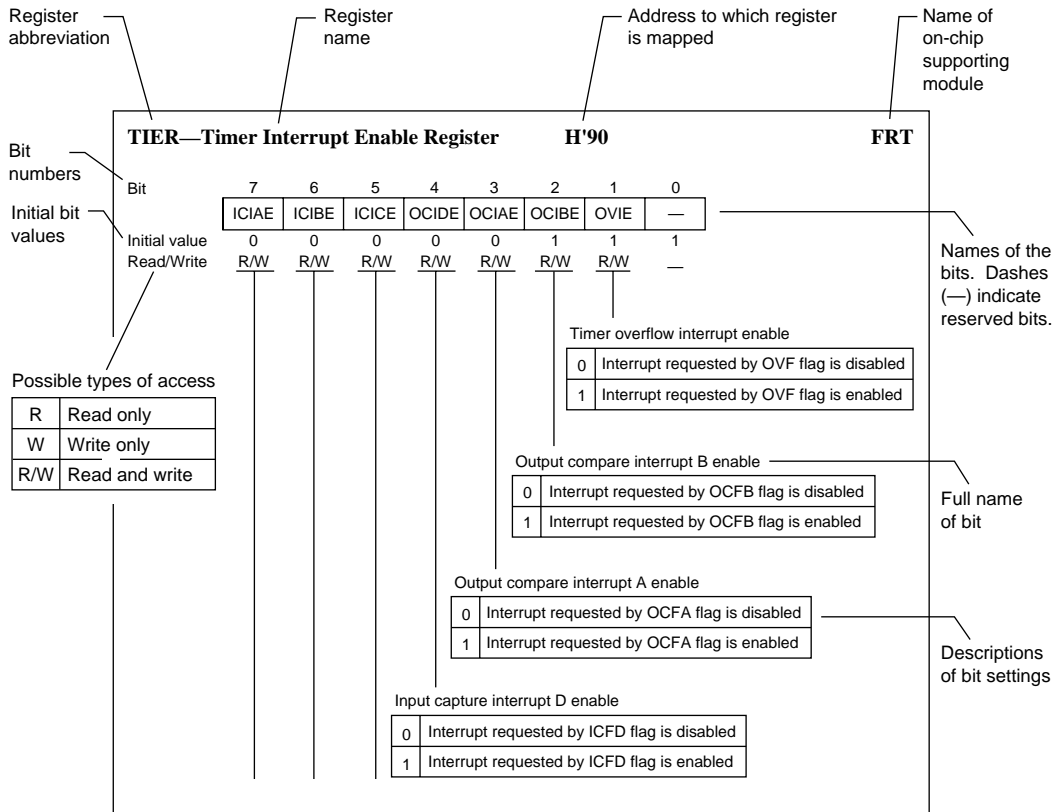

Legend:

WDT : Watchdog timer

TPC : Programmable timing pattern controller

SCI : Serial communication interface

MDCR—Mode Control Register

H'EE011

System control

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	MDS2	MDS1	MDS0
Initial value	1	1	0	0	0	—*	—*	—*
Read/Write	—	—	—	—	—	R	R	R

Mode select 2 to 0

0	0	0	—
		1	Mode 1
	1	0	Mode 2
		1	Mode 3
1	0	0	Mode 4
		1	Mode 5
	1	0	Mode 6
		1	Mode 7

Note: * Determined by the state of the mode pins (MD₂ to MD₀).

SYSCR—System Control Register

H'EE012

System control

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	SSOE	RAME
Initial value	0	0	0	0	1	0	0	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

0	On-chip RAM is disabled
1	On-chip RAM is enabled

0	In software standby mode, all address bus and bus control signals are high-impedance
1	In software standby mode, address bus retains output state and bus control signals are fixed high

0	An interrupt is requested at the falling edge of NMI
1	An interrupt is requested at the rising edge of NMI

0	CCR bit 6 (UI) is used as an interrupt mask bit
1	CCR bit 6 (UI) is used as a user bit

2	1	0	0	
			0	1
1	0	1	0	
			0	1
0	0	1	0	
			0	1

0	SLEEP instruction causes transition to sleep mode
1	SLEEP instruction causes transition to software standby mode

BRCR—Bus Release Control Register**H'EE013****Bus controller**

Bit	7	6	5	4	3	2	1	0
	A23E	A22E	A21E	A20E	—	—	—	BRLE
Modes 1, 2, 6, 7	Initial value Read/Write	1 —	1 —	1 —	1 —	1 —	1 —	0 R/W
Modes 3, 4	Initial value Read/Write	1 R/W	1 R/W	1 —	0 —	1 —	1 —	1 R/W
Mode 5	Initial value Read/Write	1 R/W	1 R/W	1 R/W	1 —	1 —	1 —	0 R/W

Address 23 to 20 enable	
0	Address output
1	Other input/output

Bus release enable	
0	The bus cannot be released to an external device
1	The bus can be released to an external device

ISCR—IRQ Sense Control Register**H'EE014****Interrupt Controller**

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5SC	IRQ4SC	IRQ3SC	IRQ2SC	IRQ1SC	IRQ0SC
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IRQ5 to IRQ0 sense control	
0	Interrupts are requested when \overline{IRQ}_5 to \overline{IRQ}_0 are low
1	Interrupts are requested by falling-edge input at \overline{IRQ}_5 to \overline{IRQ}_0

IER—IRQ Enable Register

H'EE015

Interrupt Controller

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5E	IRQ4E	IRQ3E	IRQ2E	IRQ1E	IRQ0E
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IRQ₅ to IRQ₀ enable

0	IRQ ₅ to IRQ ₀ interrupts are disabled
1	IRQ ₅ to IRQ ₀ interrupts are enabled

ISR—IRQ Status Register

H'EE016

Interrupt Controller

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5F	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value	0	0	0	0	0	0	0	0
Read/Write	—	—	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

IRQ₅ to IRQ₀ flags

0	<p>[Clearing conditions]</p> <ul style="list-style-type: none"> Read IRQ_nF when IRQ_nF = 1, then write 0 in IRQ_nF. IRQ_nSC = 0, $\overline{\text{IRQ}}_n$ input is high, and interrupt exception handling is being carried out. IRQ_nSC = 1 and IRQ_n interrupt exception handling is being carried out.
1	<p>[Setting conditions]</p> <ul style="list-style-type: none"> IRQ_nSC = 0 and $\overline{\text{IRQ}}_n$ input is low. IRQ_nSC = 1 and $\overline{\text{IRQ}}_n$ input changes from high to low.

(n = 5 to 0)

Note: * Only 0 can be written to clear the flags.

IPRA—Interrupt Priority Register A**H'EE018****Interrupt Controller**

Bit	7	6	5	4	3	2	1	0
	IPRA7	IPRA6	IPRA5	IPRA4	IPRA3	IPRA2	IPRA1	IPRA0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level A7 to A0

0	Priority level 0 (low priority)
1	Priority level 1 (high priority)

- Interrupt sources controlled by each bit

IPRA	Bit	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
		IPRA7	IPRA6	IPRA5	IPRA4	IPRA3	IPRA2	IPRA1	IPRA0
	Interrupt source	IRQ ₀	IRQ ₁	IRQ ₂ , IRQ ₃	IRQ ₄ , IRQ ₅	WDT, A/D con- verter	16-bit timer channel 0	16-bit timer channel 1	16-bit timer channel 2

IPRB—Interrupt Priority Register B**H'EE019****Interrupt Controller**

Bit	7	6	5	4	3	2	1	0
	IPRB7	IPRB6	—	—	IPRB3	IPRB2	—	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level B7, B6, B3, and B2

0	Priority level 0 (low priority)
1	Priority level 1 (high priority)

- Interrupt sources controlled by each bit

IPRB	Bit	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
		IPRB7	IPRB6	—	—	IPRB3	IPRB2	—	—
	Interrupt source	8-bit timer channels 0 and 1	8-bit timer channels 2 and 3	—	—	SCI channel 0	SCI channel 1	—	—

DASTCR—D/A Standby Control Register**H'EE01A****D/A**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DASTE
Initial value	1	1	1	1	1	1	1	0
Read/Write	—	—	—	—	—	—	—	R/W

D/A standby enable

0	D/A output is disabled in software standby mode (Initial value)
1	D/A output is enabled in software standby mode

DIVCR—Division Control Register**H'EE01B****System control**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DIV1	DIV0
Initial value	1	1	1	1	1	1	0	0
Read/Write	—	—	—	—	—	—	R/W	R/W

Division ratio bits 1 and 0

Bit 1	Bit 0	Frequency Division Ratio
DIV1	DIV0	
0	0	1/1 (Initial value)
	1	1/2
1	0	1/4
	1	1/8

MSTCRH—Module Standby Control Register H **H'EE01C** **System control**

Bit	7	6	5	4	3	2	1	0
	PSTOP	—	—	—	—	—	MSTPH1	MSTPH0
Initial value	0	1	1	1	1	0	0	0
Read/Write	R/W	—	—	—	—	R/W	R/W	R/W

Reserved bits

Module standby H1 to H0
Selection bits for placing modules in standby state.

ϕ **clock stop**
Enables or disables ϕ clock output.

MSTCRL—Module Standby Control Register L **H'EE01D** **System control**

Bit	7	6	5	4	3	2	1	0
	—	—	—	MSTPL4	MSTPL3	MSTPL2	—	MSTPL0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

Module standby L4 to L2, L0
Selection bits for placing modules in standby state.

ADRCR—Address Control Register

H'EE01E

Bus controller

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADRCTL
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	R/W

Reserved bits
Address control

Selects address update mode 1 or address update mode 2.

ADRCTL	Description
0	Address update mode 2 is selected
1	Address update mode 1 is selected (Initial value)

Note:

CSCR—Chip Select Control Register**H'EE01F****Bus controller**

Bit	7	6	5	4	3	2	1	0
	CS7E	CS6E	CS5E	CS4E	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Chip select 7 to 4 enable

Bit n	Description
CSnE	
0	Output of chip select signal \overline{CSn} is disabled (Initial value)
1	Output of chip select signal \overline{CSn} is enabled

(n = 7 to 4)

ABWCR—Bus Width Control Register**H'EE020****Bus controller**

Bit	7	6	5	4	3	2	1	0
	ABW7	ABW6	ABW5	ABW4	ABW3	ABW2	ABW1	ABW0
Modes 1, 3, 5, 6, and 7	Initial value	1	1	1	1	1	1	1
Modes 2 and 4	Initial value	0	0	0	0	0	0	0
	Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 7 to 0 bus width control

Bits 7 to 0	Bus Width of Access Area
ABW7 to ABW0	
0	Areas 7 to 0 are 16-bit access areas
1	Areas 7 to 0 are 8-bit access areas

ASTCR—Access State Control Register

H'EE021

Bus controller

Bit	7	6	5	4	3	2	1	0
	AST7	AST6	AST5	AST4	AST3	AST2	AST1	AST0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 7 to 0 access state control

Bits 7 to 0	Number of States in Access Area
AST7 to AST0	
0	Areas 7 to 0 are two-state access areas
1	Areas 7 to 0 are three-state access areas

WCRH—Wait Control Register H

H'EE022

Bus controller

Bit	7	6	5	4	3	2	1	0
	W71	W70	W61	W60	W51	W50	W41	W40
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 4 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

Area 5 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

Area 6 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

Area 7 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

WCRL—Wait Control Register L

H'EE023

Bus controller

Bit	7	6	5	4	3	2	1	0
	W31	W30	W21	W20	W11	W10	W01	W00
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 0 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

Area 1 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

Area 2 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

Area 3 wait control 1 and 0

0	0	No program wait is inserted
	1	1 program wait state is inserted
1	0	2 program wait states are inserted
	1	3 program wait states are inserted

BCR—Bus Control Register

H'EE024

Bus controller

Bit	7	6	5	4	3	2	1	0
	ICIS1	ICIS0	—	—	—	—	RDEA	WAITE
Initial value	1	1	0*	0*	0*	1	1	0
Read/Write	R/W	R/W	—	—	—	—	R/W	R/W

Wait pin enable	
0	WAIT pin wait input is disabled
1	WAIT pin wait input is enabled

Area division unit select	
0	Area divisions are as follows: Area 0: 2 MB Area 4: 1.93 MB Area 1: 2 MB Area 5: 4 kB Area 2: 8 MB Area 6: 23.75 kB Area 3: 2 MB Area 7: 22 B
1	Areas 0 to 7 are the same size (2 MB)

Idle cycle insertion 0	
0	No idle cycle is inserted in case of consecutive external read and write cycles
1	Idle cycle is inserted in case of consecutive external read and write cycles

Idle cycle insertion 1	
0	No idle cycle is inserted in case of consecutive external read cycles for different areas
1	Idle cycle is inserted in case of consecutive external read cycles for different areas

Note: * These bits can be read and written, but must not be set to 1. Normal operation cannot be guaranteed if 1 is written in these bits.

FLMCR (FLMCR1)—Flash Memory Control Register

H'EE030

Flash Memory

Note: * Fix the FWE pin low in mode 6.

Flash memory error

Bit 7	Description
FLER	
0	Flash memory program/erase protection (error protection* ¹) is disabled (Initial value) [Clearing condition] WDT reset, reset via the $\overline{\text{RES}}$ pin, or hardware standby mode
1	An error has occurred during flash memory programming/erasing, and error protection* ¹ is enabled [Setting conditions] <ul style="list-style-type: none"> When flash memory is read*² during programming/erasing (including a vector read or instruction fetch, but excluding reads in a RAM area overlapping flash memory space) Immediately after the start of exception handling during programming/erasing (but excluding reset, illegal instruction, trap instruction, and division-by-zero exception handling)*³ When a SLEEP instruction (including software standby) is executed during programming/erasing When the bus is released during programming/erasing

- Notes: 1. See section 18.7.3, Error Protection, for details.
2. The read value in this case is undefined.
3. Before the exception handling stack or vector read is performed.

TSTR—Timer Start Register

H'FFF60

16-bit timer (all channels)

TSNC—Timer Synchro Register

H'FFF61

16-bit timer (all channels)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SYNC2	SYNC1	SYNC0
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Reserved bits

Timer sync 0

0	Channel 0 timer counter (16TCNT0) operates independently (16TCNT0 presetting/clearing is independent of other channels) (Initial value)
1	Channel 0 operates synchronously Synchronous presetting/synchronous clearing of 16TCNT0 is possible

Timer sync 1

0	Channel 1 timer counter (16TCNT1) operates independently (16TCNT1 presetting/clearing is independent of other channels) (Initial value)
1	Channel 1 operates synchronously Synchronous presetting/synchronous clearing of 16TCNT1 is possible

Timer sync 2

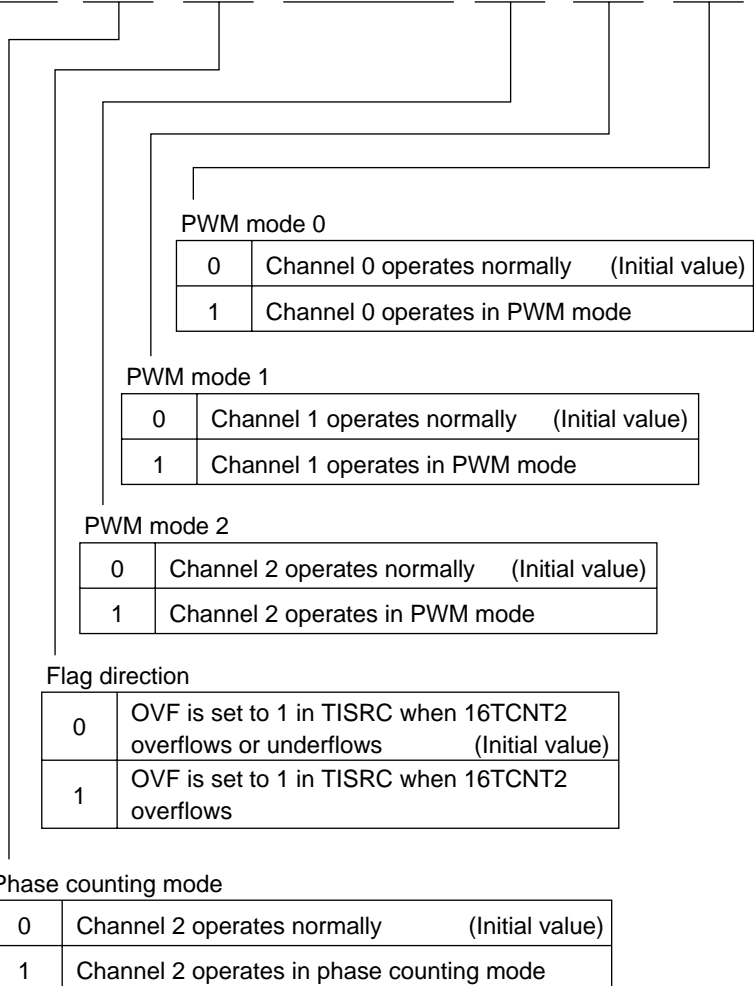

0	Channel 2 timer counter (16TCNT2) operates independently (16TCNT2 presetting/clearing is independent of other channels) (Initial value)
1	Channel 2 operates synchronously Synchronous presetting/synchronous clearing of 16TCNT2 is possible

TMDR—Timer Mode Register

H'FFF62

16-bit timer (all channels)

Bit	7	6	5	4	3	2	1	0
	—	MDF	FDIR	—	—	PWM2	PWM1	PWM0
Initial value	1	0	0	1	1	0	0	0
Read/Write	—	R/W	R/W	—	—	R/W	R/W	R/W

TOLR—Timer Output Level Setting Register H'FFF63 16-bit timer (all channels)

Bit	7	6	5	4	3	2	1	0
	—	—	TOB2	TOA2	TOB1	TOA1	TOB0	TOA0
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	W	W	W	W	W	W

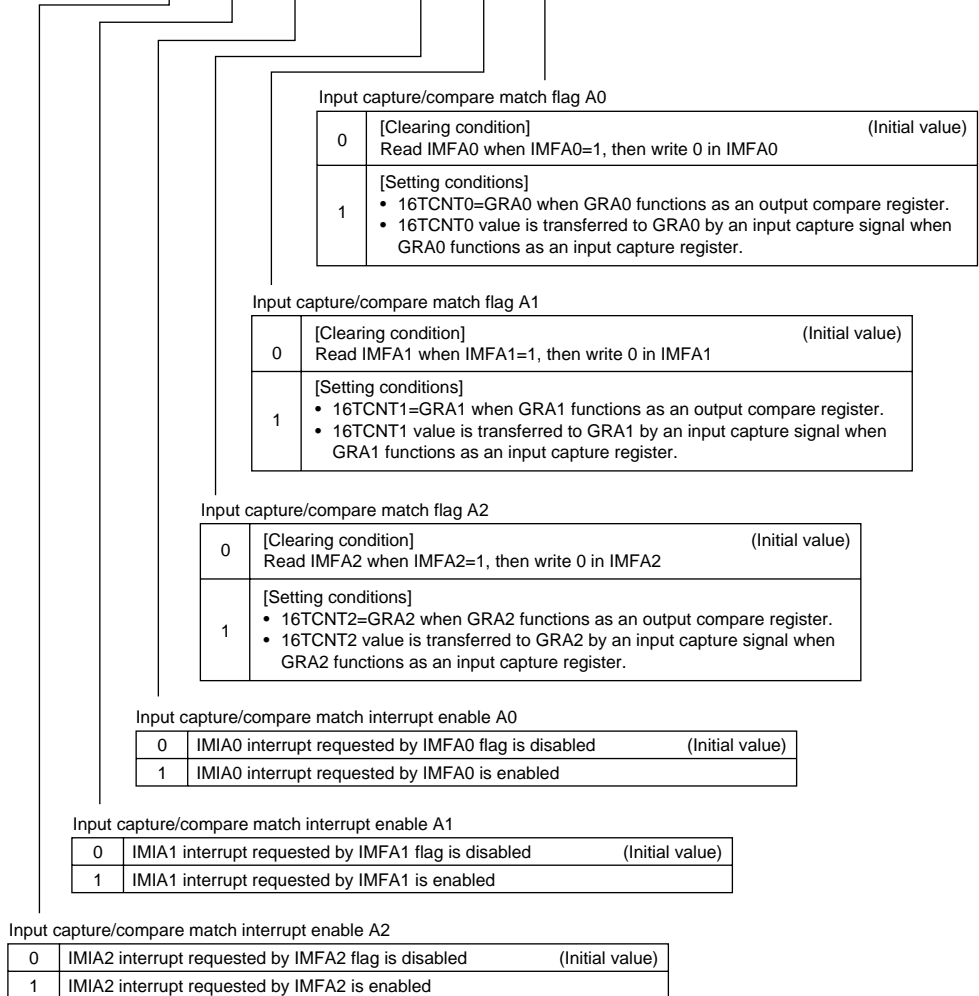

TISRA—Timer Interrupt Status Register A

H'FFF64

16-bit timer (all channels)

Bit:	7	6	5	4	3	2	1	0
	—	IMIEA2	IMIEA1	IMIEA0	—	IMFA2	IMFA1	IMFA0
Initial value:	1	0	0	0	1	0	0	0
Read/Write:	—	R/W	R/W	R/W	—	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written to clear the flag.

TISRB—Timer Interrupt Status Register B

H'FFF65

16-bit timer (all channels)

Bit:	7	6	5	4	3	2	1	0
	—	IMIEB2	IMIEB1	IMIEB0	—	IMFB2	IMFB1	IMFB0
Initial value:	1	0	0	0	1	0	0	0
Read/Write:	—	R/W	R/W	R/W	—	R/(W)*	R/(W)*	R/(W)*

Input capture/compare match flag B0

0	[Clearing condition] Read IMFB0 when IMFB0=1, then write 0 in IMFB0.	(Initial value)
1	[Setting conditions] • 16TCNT0=GRB0 when GRB0 functions as an output compare register. • 16TCNT0 value is transferred to GRB0 by an input capture signal when GRB0 functions as an input capture register.	

Input capture/compare match flag B1

0	[Clearing condition] Read IMFB1 when IMFB1=1, then write 0 in IMFB1.	(Initial value)
1	[Setting conditions] • 16TCNT1=GRB1 when GRB1 functions as an output compare register. • 16TCNT1 value is transferred to GRB1 by an input capture signal when GRB1 functions as an input capture register.	

Input capture/compare match flag B2

0	[Clearing condition] Read IMFB2 when IMFB2=1, then write 0 in IMFB2.	(Initial value)
1	[Setting conditions] • 16TCNT2=GRB2 when GRB2 functions as an output compare register. • 16TCNT2 value is transferred to GRB2 by an input capture signal when GRB2 functions as an input capture register.	

Input capture/compare match interrupt enable B0

0	IMIB0 interrupt requested by IMFB0 flag is disabled	(Initial value)
1	IMIB0 interrupt requested by IMFB0 is enabled	

Input capture/compare match interrupt enable B1

0	IMIB1 interrupt requested by IMFB1 flag is disabled	(Initial value)
1	IMIB1 interrupt requested by IMFB1 is enabled	

Input capture/compare match interrupt enable B2

0	IMIB2 interrupt requested by IMFB2 flag is disabled	(Initial value)
1	IMIB2 interrupt requested by IMFB2 is enabled	

Note: * Only 0 can be written to clear the flag.

TISRC—Timer Interrupt Status Register C

H'FFF66

16-bit timer (all channels)

Bit:	7	6	5	4	3	2	1	0
	—	OVIE2	OVIE1	OVIE0	—	OVF2	OVF1	OVF0
Initial value:	1	0	0	0	1	0	0	0
Read/Write:	—	R/W	R/W	R/W	—	R/(W)*	R/(W)*	R/(W)*

Overflow flag 0

0	[Clearing condition] Read OVF0 when OVF0 = 1, then write 0 in OVF0.	(Initial value)
1	[Setting condition] 16TCNT0 overflowed from H'FFFF to H'0000.	

Overflow flag 1

0	[Clearing condition] Read OVF1 when OVF1 = 1, then write 0 in OVF1.	(Initial value)
1	[Setting condition] 16TCNT1 overflowed from H'FFFF to H'0000.	

Overflow flag 2

0	[Clearing condition] Read OVF2 when OVF2 = 1, then write 0 in OVF2.	(Initial value)
1	[Setting condition] 16TCNT2 overflowed from H'FFFF to H'0000, or underflowed from H'0000 to H'FFFF.	

Overflow interrupt enable 0

0	OVI0 interrupt requested by OVF0 flag is disabled	(Initial value)
1	OVI0 interrupt requested by OVF0 flag is enabled	

Overflow interrupt enable 1

0	OVI1 interrupt requested by OVF1 flag is disabled	(Initial value)
1	OVI1 interrupt requested by OVF1 flag is enabled	

Overflow interrupt enable 2

0	OVI2 interrupt requested by OVF2 flag is disabled	(Initial value)
1	OVI2 interrupt requested by OVF2 flag is enabled	

Note: * Only 0 can be written to clear the flag.

16TCR0—Timer Control Register 0

H'FFF68

16-bit timer channel 0

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Timer prescaler 2 to 0

Bit 2	Bit 1	Bit 0	Description
TPSC2	TPSC1	TPSC0	
0	0	0	Internal clock : ϕ (Initial value)
		1	Internal clock : $\phi / 2$
	1	0	Internal clock : $\phi / 4$
		1	Internal clock : $\phi / 8$
1	0	0	External clock A : TCLKA input
		1	External clock B : TCLKB input
	1	0	External clock C : TCLKC input
		1	External clock D : TCLKD input

Clock edge 1 and 0

Bit 4	Bit 3	Description
CKEG	CKEG0	
0	0	Rising edges counted (Initial value)
0	1	Falling edges counted
1	—	Both edges counted

Counter clear 1 and 0

Bit 6	Bit 5	Description
CCLR1	CCLR0	
0	0	16TCNT is not cleared (Initial value)
	1	16TCNT is cleared by GRA compare match or input capture
1	0	16TCNT is cleared by GRB compare match or input capture
	1	Synchronous clear : 16TCNT is cleared in synchronization with other synchronized timers

TIOR0—Timer I/O Control Register 0

H'FFF69

16-bit timer channel 0

Bit:	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value:	1	0	0	0	1	0	0	0
Read/Write:	—	R/W	R/W	R/W	—	R/W	R/W	R/W

I/O control A2 to A0

Bit 2	Bit 1	Bit 0	Description	
IOA2	IOA1	IOA0		
0	0	0	GRA is an output compare register	No output at compare match (Initial value)
		1		0 output at GRA compare match
	1	0		1 output at GRA compare match
		1		Output toggles at GRA compare match (1 output on channel 2)
1	0	0	GRA is an input capture register	GRA captures rising edges of input
		1		GRA captures falling edges of input
	1	0		GRB captures both edges of input
		1		

I/O control B2 to B0

Bit 6	Bit 5	Bit 4	Description	
IOB2	IOB1	IOB0		
0	0	0	GRB is an output compare register	No output at compare match (Initial value)
		1		0 output at GRB compare match
	1	0		1 output at GRB compare match
		1		Output toggles at GRB compare match (1 output on channel 2)
1	0	0	GRB is an input capture register	GRB captures rising edges of input
		1		GRB captures falling edges of input
	1	0		GRB captures both edges of input
		1		

16TCNT0 H/L—Timer Counter 0 H/L H'FFF6A, H'FFF6B 16-bit timer channel 0

Bit 1	Bit 0	Description
0	0	No change at compare match A
	1	0 output at compare match A
1	0	1 output at compare match A
	1	Output toggles at compare match A

ICE in 8TCSR1	Bit 3 OIS3	Bit 2 OIS2	Description
0	0	0	No change at compare match B
		1	0 output at compare match B
	1	0	1 output at compare match B
		1	Output toggles at compare match B
1	0	0	TCORB input capture on rising edge
		1	TCORB input capture on falling edge
	1	0	TCORB input capture on both rising and falling edges
		1	

TRGE*	Bit 4 ADTE	Description
0	0	A/D converter start requests by compare match A or an external trigger are disabled
	1	A/D converter start requests by compare match A or an external trigger are disabled
1	0	A/D converter start requests by an external trigger are enabled, and A/D converter start requests by compare match A are disabled
	1	A/D converter start requests by compare match A are enabled, and A/D converter start requests by an external trigger are disabled

Note: * TRGE is bit 7 of the A/D control register (ADCR).

0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF.
1	[Setting condition] 8TCNT overflows from H'FF to H'00.

0	[Clearing condition] Read CMFA when CMFA = 1, then write 0 in CMFA.
1	[Setting condition] 8TCNT = TCORA

0	[Clearing condition] Read CMFB when CMFB = 1, then write 0 in CMFB.
1	[Setting conditions] • 8TCNT = TCORB • The 8TCNT value is transferred to TCORB by an input capture signal when TCORB functions as an input capture register.

Note: * Only 0 can be written to bits 7 to 5 to clear these flags.

8TCSR1—Timer Control/Status Register 1

H'FFF83

8-bit timer channel 1

Bit	7	6	5	4	3	2	1	0
	CMFB	CMFA	OVF	ICE	OIS3	OIS2	OS1	OS0
Initial value	0	0	0	0	0	0	0	0

	1	Asynchronous mode	Internal clock: SCK pin used for clock output
		Synchronous mode	Internal clock: SCK pin used for serial clock output
1	0	Asynchronous mode	External clock: SCK pin used for clock input
		Synchronous mode	External clock: SCK pin used for serial clock input
	1	Asynchronous mode	External clock: SCK pin used for clock input
		Synchronous mode	External clock: SCK pin used for serial clock input

SMR	Bit 1	Bit 0	Description
GM	CKE1	CKE0	
0	0	0	SCK pin available for generic I/O
		1	SCK pin used for clock output
1	0	0	SCK pin output fixed low
		1	SCK pin used for clock output
	1	0	SCK pin output fixed high
		1	SCK pin used for clock output

Transmit-end interrupt enable	
0	Transmit-end interrupt requests (TEI) are disabled
1	Transmit-end interrupt requests (TEI) are enabled

Multiprocessor interrupt enable	
0	Multiprocessor interrupts are disabled (normal receive operation)
1	Multiprocessor interrupts are enabled

Receive interrupt enable	
0	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are disabled
1	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are enabled

Transmit interrupt enable	
0	Transmit-data-empty interrupt request (TXI) is disabled
1	Transmit-data-empty interrupt request (TXI) is enabled

Receive enable	
0	Receiving is disabled
1	Receiving is enabled

Transmit enable	
0	Transmitting is disabled
1	Transmitting is enabled

TDR—Transmit Data Register**H'FFFB3****SCI0**

SSR—Serial Status Register

H'FFFB4

SCIO

Bit	7	6	5	4	3	2	1	0
Initial value	1	0	0	0	0	1	0	1
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W
							Multiprocessor bit transfer 0 Multiprocessor bit value in transmit data is 0 1 Multiprocessor bit value in transmit data is 1	
							Multiprocessor bit 0 Multiprocessor bit value in receive data is 0 1 Multiprocessor bit value in receive data is 1	
						Transmit end (for serial communication interface) 0 [Clearing condition] Read TDRE when TDRE = 1, then write 0 in TDRE. 1 [Setting conditions] • Reset or transition to standby mode • TE is cleared to 0 in SCR. • TDRE is 1 when last bit of 1-byte serial character is transmitted.		
						Transmit end (for smart card interface) 0 [Clearing condition] Read TDRE when TDRE = 1, then write 0 in TDRE. 1 [Setting conditions] • Reset or transition to standby mode • TE is cleared to 0 in SCR and FER/ERS is cleared to 0. • TDRE is 1 and FER/ERS is 0 (normal transmission) 2.5 etu* (when GM = 0) or 1.0 etu (when GM = 1) after 1-byte serial character is transmitted.		
						Note: * etu: Elementary time unit (time for transfer of 1 bit)		
					Parity error 0 [Clearing conditions] • Reset or transition to standby mode • Read PER when PER = 1, then write 0 in PER. 1 [Setting condition] Parity error (parity of receive data does not match parity setting of O/E bit in SMR)			
				Framing error (for serial communication interface) 0 [Clearing conditions] • Reset or transition to standby mode • Read FER when FER = 1, then write 0 in FER. 1 [Setting condition] Framing error (stop bit is 0)				
				Error signal status (for smart card interface) 0 [Clearing conditions] • Reset or transition to standby mode • Read ERS when ERS = 1, then write 0 in ERS. 1 [Setting condition] A low error signal is received.				
		Overrun error 0 [Clearing conditions] • Reset or transition to standby mode • Read ORER when ORER = 1, then write 0 in ORER. 1 [Setting condition] Overrun error (reception of the next serial data ends when RDRF = 1)						
		Receive data register full 0 [Clearing conditions] • Reset or transition to standby mode • Read RDRF when RDRF = 1, then write 0 in RDRF. 1 [Setting condition] Serial data is received normally and transferred from RSR to RDR.						
	Transmit data register empty 0 [Clearing condition] • Read TDRE when TDRE = 1, then write 0 in TDRE. 1 [Setting conditions] • Reset or transition to standby mode • TE is 0 in SCR. • Data is transferred from TDR to TSR, enabling new data to be written in TDR							

Note: * Only 0 can be written, to clear the flag.

	6, 7	T	T	keep	—	I/O port
PB ₃ to PB ₀	1 to 5	T	T	(CS output) ^{*6} (SSOE = 0) T (SSOE = 1) H (Otherwise) ^{*7} keep	(CS output) ^{*6} T (Otherwise) ^{*7} keep	(CS output) ^{*6} CS ₇ to CS ₄ (Otherwise) ^{*7} I/O port
	6, 7	T	T	keep	—	I/O port
PB ₇ to PB ₄	1 to 7	T	T	keep	keep	I/O port

Legend:

H : High

L : Low

T : High-impedance state

keep : Input pins are in the high-impedance state; output pins maintain their previous state.

DDR : Data direction register

Notes: 1. Low output only when WDT overflow causes a reset.

This RES0 output function is provided only in the masked ROM version.

2. When A23E, A22E, A21E = 0 in BRCR (bus release control register)

3. When A23E, A22E, A21E = 1 in BRCR (bus release control register)

4. When A20E = 0 in BRCCR (bus release control register)
5. When A20E = 1 in BRCCR (bus release control register)
6. When CS7E, CS6E, CS5E, CS4E = 1 in CSCR (chip select control register)
7. When CS7E, CS6E, CS5E, CS4E = 0 in CSCR (chip select control register)

The bus cannot be released in modes 6 and 7.

D.2 Pin States at Reset

Modes 1 and 2: Figure D.1 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during an external memory access in mode 1 or 2. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. $\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{HWR}}$, $\overline{\text{LWR}}$, and $\overline{\text{CS}}_0$ go high, and D_{15} to D_0 go to the high-impedance state. The address bus is initialized to the low output level 2.5 ϕ clock cycles after the low level of $\overline{\text{RES}}$ is sampled. Clock pin $\text{P6}_7/\phi$ goes to the output state at the next rise of ϕ after $\overline{\text{RES}}$ goes low.

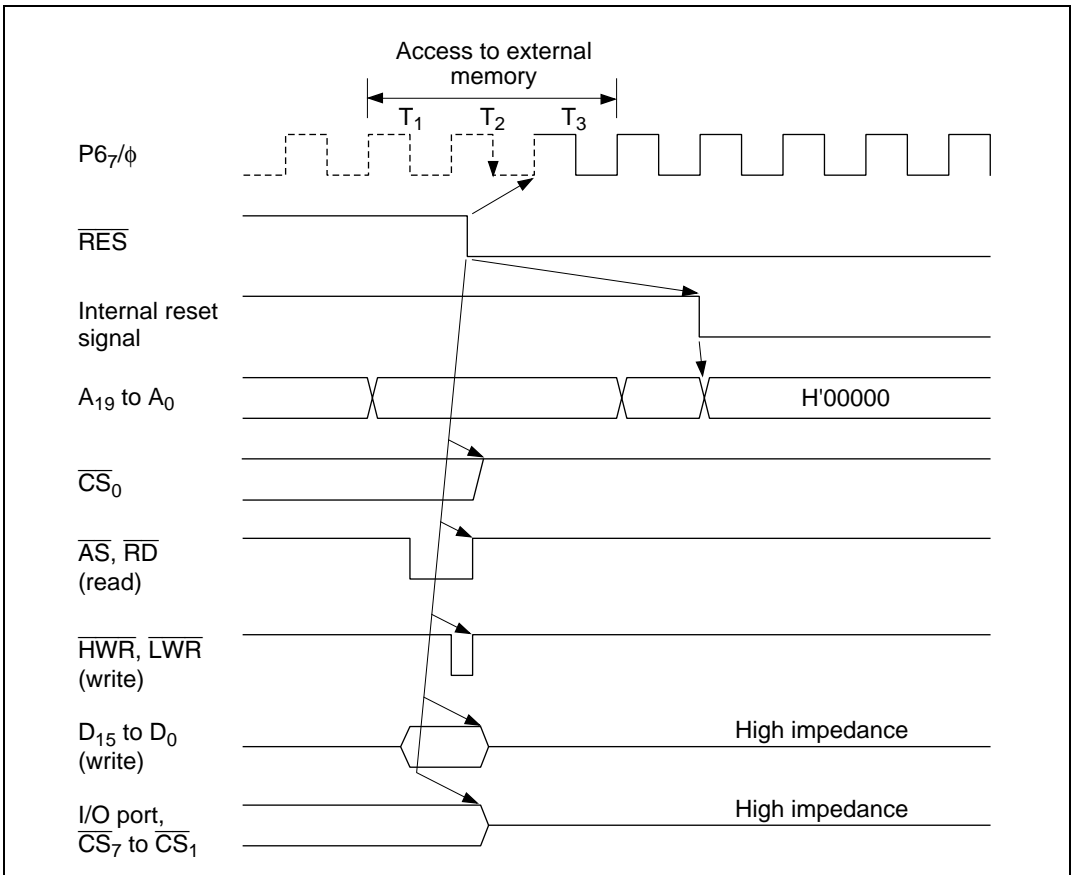

Figure D.1 Reset during Memory Access (Modes 1 and 2)

Modes 3 and 4: Figure D.2 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during an external memory access in mode 3 or 4. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. $\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{HWR}}$, $\overline{\text{LWR}}$, and $\overline{\text{CS}}_0$ go high, and D_{15} to D_0 go to the high-impedance state. The address bus is initialized to the low output level 2.5ϕ clock cycles after the low level of $\overline{\text{RES}}$ is sampled. However, when PA_4 to PA_6 are used as address bus pins, or when P8_3 to P8_1 and PB_0 to PB_3 are used as CS output pins, they go to the high-impedance state at the same time as $\overline{\text{RES}}$ goes low. Clock pin $\text{P6}_7/\phi$ goes to the output state at the next rise of ϕ after $\overline{\text{RES}}$ goes low.

Figure D.2 Reset during Memory Access (Modes 3 and 4)

Mode 5: Figure D.3 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during an external memory access in mode 5. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. $\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{HWR}}$, and $\overline{\text{LWR}}$ go high, and the address bus and D_{15} to D_0 go to the high-impedance state. Clock pin $\text{P6}_7/\phi$ goes to the output state at the next rise of ϕ after $\overline{\text{RES}}$ goes low.

Figure D.3 Reset during Memory Access (Mode 5)

Modes 6 and 7: Figure D.4 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during an operation mode 6 or 7. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. Clock pin P6₇/φ goes to the output state at the next rise of φ after $\overline{\text{RES}}$ goes low.

Figure D.4 Reset during Operation (Modes 6 and 7)

Appendix E Timing of Transition to and Recovery from Hardware Standby Mode

Timing of Transition to Hardware Standby Mode

- To retain RAM contents with the RAME bit set to 1 in SYSCR, drive the $\overline{\text{RES}}$ signal low 10 system clock cycles before the $\overline{\text{STBY}}$ signal goes low, as shown below. $\overline{\text{RES}}$ must remain low until $\overline{\text{STBY}}$ goes low (minimum delay from $\overline{\text{STBY}}$ low to $\overline{\text{RES}}$ high: 0 ns).

- To retain RAM contents with the RAME bit cleared to 0 in SYSCR, $\overline{\text{RES}}$ does not have to be driven low as in (1).

Timing of Recovery from Hardware Standby Mode

Drive the $\overline{\text{RES}}$ signal low approximately 100 ns before $\overline{\text{STBY}}$ goes high.

Appendix F Product Code Lineup

Notes: 1. Functions as $\overline{\text{RES0}}$ in the masked ROM versions, and as FWE in the on-chip flash memory versions.

2. The H8/3064F-ZTAT B-mask version, H8/3064 masked ROM B-mask version, H8/3062F-ZTAT B-mask version, H8/3062 masked ROM B-mask version, H8/3061 masked ROM B-mask version, and H8/3060 masked ROM B-mask version have a V_{CL} pin, and require an external capacitor (0.1 μF).
