

## 82C55A

### CMOS Programmable Peripheral Interface

FN2969  
Rev 11.01  
Jan 20, 2020

The 82C55A is a high performance CMOS version of the industry standard 8255A and is manufactured using a self-aligned silicon gate CMOS process (Scaled SAJI IV). It is a general purpose programmable I/O device which may be used with many different microprocessors. There are 24 I/O pins which may be individually programmed in 2 groups of 12 and used in 3 major modes of operation. The high performance and industry standard configuration of the 82C55A make it compatible with the 80C86, 80C88 and other microprocessors.

Static CMOS circuit design insures low operating power. TTL compatibility over the full military temperature range and bus hold circuitry eliminate the need for pull-up resistors. The Intersil advanced SAJI process results in performance equal to or greater than existing functionally equivalent products at a fraction of the power.

### Features

- Pb-Free Plus Anneal Available (RoHS Compliant) (See Ordering Info)
- Pin Compatible with NMOS 8255A
- 24 Programmable I/O Pins
- Fully TTL Compatible
- High Speed, No "Wait State" Operation with 5MHz and 8MHz 80C86 and 80C88
- Direct Bit Set/Reset Capability
- Enhanced Control Word Read Capability
- L7 Process
- 2.5mA Drive Capability on All I/O Ports
- Low Standby Power (ICCSB) . . . . . 10µA

### Ordering Information

## Pin Description

SYMBOL	TYPE	DESCRIPTION
V <sub>CC</sub>		V <sub>CC</sub> : The +5V power supply pin. A 0.1μF capacitor between V <sub>CC</sub> and GND is recommended for decoupling.
GND		GROUND
D0-D7	I/O	DATA BUS: The Data Bus lines are bidirectional three-state pins connected to the system data bus.
RESET	I	RESET: A high on this input clears the control register and all ports (A, B, C) are set to the input mode with the "Bus Hold" circuitry turned on.
$\overline{\text{CS}}$	I	CHIP SELECT: Chip select is an active low input used to enable the 82C55A onto the Data Bus for CPU communications.
$\overline{\text{RD}}$	I	READ: Read is an active low input control signal used by the CPU to read status information or data via the data bus.
$\overline{\text{WR}}$	I	WRITE: Write is an active low input control signal used by the CPU to load control words and data into the 82C55A.
A0-A1	I	ADDRESS: These input signals, in conjunction with the $\overline{\text{RD}}$ and $\overline{\text{WR}}$ inputs, control the selection of one of the three ports or the control word register. A0 and A1 are normally connected to the least significant bits of the Address Bus A0, A1.
PA0-PA7	I/O	PORT A: 8-bit input and output port. Both bus hold high and bus hold low circuitry are present on this port.
PB0-PB7	I/O	PORT B: 8-bit input and output port. Bus hold high circuitry is present on this port.
PC0-PC7	I/O	PORT C: 8-bit input and output port. Bus hold circuitry is present on this port.

## Functional Diagram

## Functional Description

### Data Bus Buffer

This three-state bidirectional 8-bit buffer is used to interface the 82C55A to the system data bus. Data is transmitted or received by the buffer upon execution of input or output instructions by the CPU. Control words and status information are also transferred through the data bus buffer.

### Read/Write and Control Logic

The function of this block is to manage all of the internal and external transfers of both Data and Control or Status words. It accepts inputs from the CPU Address and Control busses and in turn, issues commands to both of the Control Groups.

**(CS)** Chip Select. A “low” on this input pin enables the communication between the 82C55A and the CPU.

**(RD)** Read. A “low” on this input pin enables 82C55A to send the data or status information to the CPU on the data bus. In essence, it allows the CPU to “read from” the 82C55A.

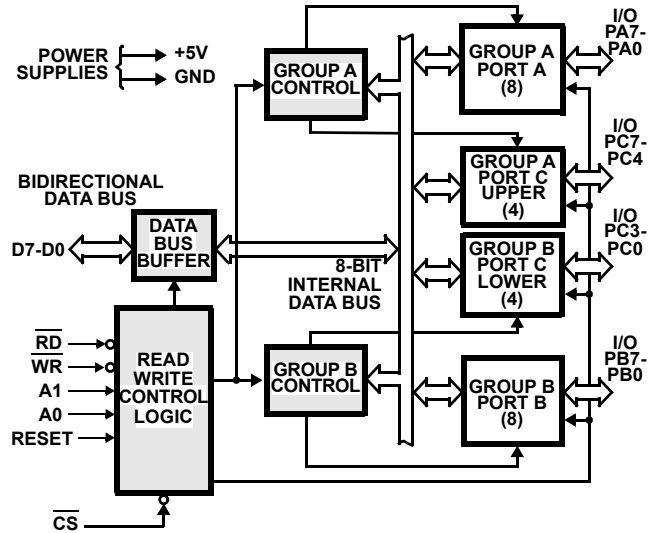

**(WR)** Write. A “low” on this input pin enables the CPU to write data or control words into the 82C55A.

**(A0 and A1)** Port Select 0 and Port Select 1. These input signals, in conjunction with the RD and WR inputs, control the selection of one of the three ports or the control word register. They are normally connected to the least significant bits of the address bus (A0 and A1).

#### 82C55A BASIC OPERATION

A1	A0	$\overline{RD}$	$\overline{WR}$	$\overline{CS}$	INPUT OPERATION (READ)
0	0	0	1	0	Port A → Data Bus
0	1	0	1	0	Port B → Data Bus
1	0	0	1	0	Port C → Data Bus
1	1	0	1	0	Control Word → Data Bus
					OUTPUT OPERATION (WRITE)
0	0	1	0	0	Data Bus → Port A
0	1	1	0	0	Data Bus → Port B
1	0	1	0	0	Data Bus → Port C
1	1	1	0	0	Data Bus → Control
					DISABLE FUNCTION
X	X	X	X	1	Data Bus → Three-State
X	X	1	1	0	Data Bus → Three-State

**(RESET)** Reset. A “high” on this input initializes the control register to 9Bh and all ports (A, B, C) are set to the input mode. “Bus hold” devices internal to the 82C55A will hold the I/O port inputs to a logic “1” state with a maximum hold current of 400µA.

**FIGURE 1. 82C55A BLOCK DIAGRAM. DATA BUS BUFFER, READ/WRITE, GROUP A & B CONTROL LOGIC FUNCTIONS**

### Group A and Group B Controls

The functional configuration of each port is programmed by the systems software. In essence, the CPU “outputs” a control word to the 82C55A. The control word contains information such as “mode”, “bit set”, “bit reset”, etc., that initializes the functional configuration of the 82C55A.

Each of the Control blocks (Group A and Group B) accepts “commands” from the Read/Write Control logic, receives “control words” from the internal data bus and issues the proper commands to its associated ports.

Control Group A - Port A and Port C upper (C7 - C4)

Control Group B - Port B and Port C lower (C3 - C0)

The control word register can be both written and read as shown in the “Basic Operation” table. Figure 4 shows the control word format for both Read and Write operations. When the control word is read, bit D7 will always be a logic “1”, as this implies control word mode information.

### Ports A, B, and C

The 82C55A contains three 8-bit ports (A, B, and C). All can be configured to a wide variety of functional characteristics by the system software but each has its own special features or “personality” to further enhance the power and flexibility of the 82C55A.

**Port A** One 8-bit data output latch/buffer and one 8-bit data input latch. Both “pull-up” and “pull-down” bus-hold devices are present on Port A. See Figure 2A.

**Port B** One 8-bit data input/output latch/buffer and one 8-bit data input buffer. See Figure 2B.

**Port C** One 8-bit data output latch/buffer and one 8-bit data input buffer (no latch for input). This port can be divided into

two 4-bit ports under the mode control. Each 4-bit port contains a 4-bit latch and it can be used for the control signal output and status signal inputs in conjunction with ports A and B. See Figure 2B.

FIGURE 2A. PORT A BUS-HOLD CONFIGURATION

FIGURE 2B. PORT B AND C BUS-HOLD CONFIGURATION

FIGURE 2. BUS-HOLD CONFIGURATION

### Operational Description

#### Mode Selection

There are three basic modes of operation that can be selected by the system software:

- Mode 0 - Basic Input/Output
- Mode 1 - Strobed Input/Output
- Mode 2 - Bidirectional Bus

When the reset input goes “high”, all ports will be set to the input mode with all 24 port lines held at a logic “one” level by internal bus hold devices. After the reset is removed, the 82C55A can remain in the input mode with no additional initialization required. This eliminates the need to pull-up or pull-down resistors in all-CMOS designs. The control word register will contain 9Bh. During the execution of the system program, any of the other modes may be selected using a single output instruction. This allows a single 82C55A to service a variety of peripheral devices with a simple software maintenance routine. Any port programmed as an output port is initialized to all zeros when the control word is written.

FIGURE 3. BASIC MODE DEFINITIONS AND BUS INTERFACE

FIGURE 4. MODE DEFINITION FORMAT

The modes for Port A and Port B can be separately defined, while Port C is divided into two portions as required by the Port A and Port B definitions. All of the output registers, including the status flip-flops, will be reset whenever the mode is changed. Modes may be combined so that their functional definition can be “tailored” to almost any I/O structure. For instance: Group B can be programmed in Mode 0 to monitor simple switch closings or display computational results, Group A could be programmed in Mode 1 to monitor a keyboard or tape reader on an interrupt-driven basis.

The mode definitions and possible mode combinations may seem confusing at first, but after a cursory review of the complete device operation a simple, logical I/O approach will surface. The design of the 82C55A has taken into account things such as efficient PC board layout, control signal definition vs. PC layout and complete functional flexibility to support almost any peripheral device with no external logic. Such design represents the maximum use of the available pins.

**Single Bit Set/Reset Feature (Figure 5)**

Any of the eight bits of Port C can be Set or Reset using a single Output instruction. This feature reduces software requirements in control-based applications.

When Port C is being used as status/control for Port A or B, these bits can be set or reset by using the Bit Set/Reset operation just as if they were output ports.

FIGURE 5. BIT SET/RESET FORMAT

**Interrupt Control Functions**

When the 82C55A is programmed to operate in mode 1 or mode 2, control signals are provided that can be used as interrupt request inputs to the CPU. The interrupt request signals, generated from port C, can be inhibited or enabled by setting or resetting the associated INTE flip-flop, using the bit set/reset function of port C.

This function allows the programmer to enable or disable a CPU interrupt by a specific I/O device without affecting any other device in the interrupt structure.

**INTE Flip-Flop Definition**

(BIT-SET)-INTE is SET - Interrupt Enable

(BIT-RESET)-INTE is Reset - Interrupt Disable

NOTE: All Mask flip-flops are automatically reset during mode selection and device Reset.

**Operating Modes**

**Mode 0** (Basic Input/Output). This functional configuration provides simple input and output operations for each of the three ports. No handshaking is required, data is simply written to or read from a specific port.

Mode 0 Basic Functional Definitions:

- Two 8-bit ports and two 4-bit ports
- Any Port can be input or output
- Outputs are latched
- Inputs are not latched
- 16 different Input/Output configurations possible

MODE 0 PORT DEFINITION

A		B		GROUP A		#	GROUP B	
D4	D3	D1	D0	PORT A	PORTC (Upper)		PORT B	PORTC (Lower)
0	0	0	0	Output	Output	0	Output	Output

**Operating Modes**

**Mode 1 - (Strobed Input/Output).** This functional configuration provides a means for transferring I/O data to or from a specified port in conjunction with strobes or “hand shaking” signals. In mode 1, port A and port B use the lines on port C to generate or accept these “hand shaking” signals.

Mode 1 Basic Function Definitions:

- Two Groups (Group A and Group B)
- Each group contains one 8-bit port and one 4-bit control/data port
- The 8-bit data port can be either input or output. Both inputs and outputs are latched.
- The 4-bit port is used for control and status of the 8-bit port.

**Input Control Signal Definition**

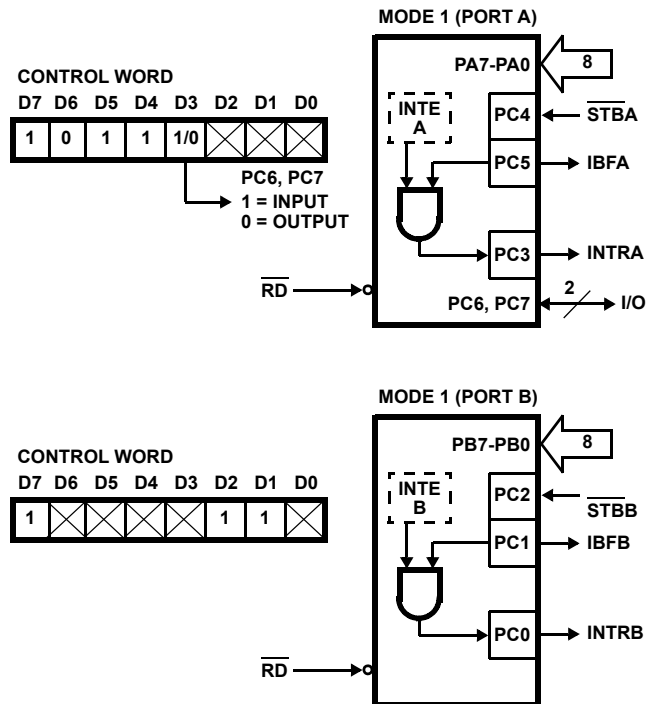

(Figures 6 and 7)

**STB (Strobe Input)**

A “low” on this input loads data into the input latch.

**IBF (Input Buffer Full F/F)**

A “high” on this output indicates that the data has been loaded into the input latch: in essence, an acknowledgment. IBF is set by STB input being low and is reset by the rising edge of the RD input.

**FIGURE 6. MODE 1 INPUT**

FIGURE 7. MODE 1 (STROBED INPUT)

**INTR (Interrupt Request)**

A “high” on this output can be used to interrupt the CPU when an input device is requesting service. INTR is set by the condition:  $\overline{STB}$  is a “one”,  $\overline{IBF}$  is a “one” and  $\overline{INTE}$  is a “one”. It is reset by the falling edge of  $\overline{RD}$ . This procedure allows an input device to request service from the CPU by simply strobing its data into the port.

**INTE A**

Controlled by bit set/reset of PC4.

**INTE B**

Controlled by bit set/reset of PC2.

**Output Control Signal Definition**

(Figure 8 and 9)

**$\overline{OBF}$**  - (Output Buffer Full F/F). The  $\overline{OBF}$  output will go “low” to indicate that the CPU has written data out to the specified port. This does not mean valid data is sent out of the port at this time since  $\overline{OBF}$  can go true before data is available. Data is guaranteed valid at the rising edge of  $\overline{OBF}$ , (See Note 1). The  $\overline{OBF}$  F/F will be set by the rising edge of the  $\overline{WR}$  input and reset by  $\overline{ACK}$  input being low.

**$\overline{ACK}$**  - (Acknowledge Input). A “low” on this input informs the 82C55A that the data from Port A or Port B is ready to be accepted. In essence, a response from the peripheral device indicating that it is ready to accept data, (See Note 1).

**INTR** - (Interrupt Request). A “high” on this output can be used to interrupt the CPU when an output device has accepted data transmitted by the CPU. INTR is set when  $\overline{ACK}$  is a “one”,  $\overline{OBF}$  is a “one” and  $\overline{INTE}$  is a “one”. It is reset by the falling edge of  $\overline{WR}$ .

**INTE A**

Controlled by Bit Set/Reset of PC6.

**INTE B**

Controlled by Bit Set/Reset of PC2.

NOTE:

1. To strobe data into the peripheral device, the user must operate the strobe line in a hand shaking mode. The user needs to send  $\overline{OBF}$  to the peripheral device, generates an  $\overline{ACK}$  from the peripheral device and then latch data into the peripheral device on the rising edge of  $\overline{OBF}$ .

FIGURE 8. MODE 1 OUTPUT

FIGURE 9. MODE 1 (STROBED OUTPUT)

FIGURE 10. COMBINATIONS OF MODE 1

Combinations of Mode 1: Port A and Port B can be individually defined as input or output in Mode 1 to support a wide variety of strobed I/O applications.

**Operating Modes**

**Mode 2 (Strobed Bidirectional Bus I/O)**

This functional configuration provides a means for communicating with a peripheral device or structure on a single 8-bit bus for both transmitting and receiving data (bidirectional bus I/O). “Hand shaking” signals are provided to maintain proper bus flow discipline similar to Mode 1. Interrupt generation and enable/disable functions are also available.

Mode 2 Basic Functional Definitions:

- Used in Group A only
- One 8-bit, bidirectional bus Port (Port A) and a 5-bit control Port (Port C)
- Both inputs and outputs are latched
- The 5-bit control port (Port C) is used for control and status for the 8-bit, bidirectional bus port (Port A)

**Bidirectional Bus I/O Control Signal Definition**

(Figures 11, 12, 13, 14)

**INTR** - (Interrupt Request). A high on this output can be used to interrupt the CPU for both input or output operations.

**Output Operations**

**OBF** - (Output Buffer Full). The  $\overline{\text{OBF}}$  output will go “low” to indicate that the CPU has written data out to port A.

**ACK** - (Acknowledge). A “low” on this input enables the three-state output buffer of port A to send out the data. Otherwise, the output buffer will be in the high impedance state.

**INTE 1** - (The INTE flip-flop associated with  $\overline{\text{OBF}}$ ). Controlled by bit set/reset of PC4.

**Input Operations**

**STB** - (Strobe Input). A “low” on this input loads data into the input latch.

**IBF** - (Input Buffer Full F/F). A “high” on this output indicates that data has been loaded into the input latch.

**INTE 2** - (The INTE flip-flop associated with IBF). Controlled by bit set/reset of PC4.

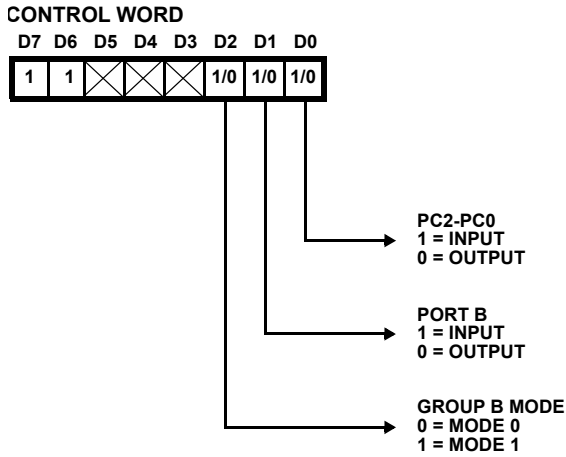

FIGURE 11. MODE CONTROL WORD

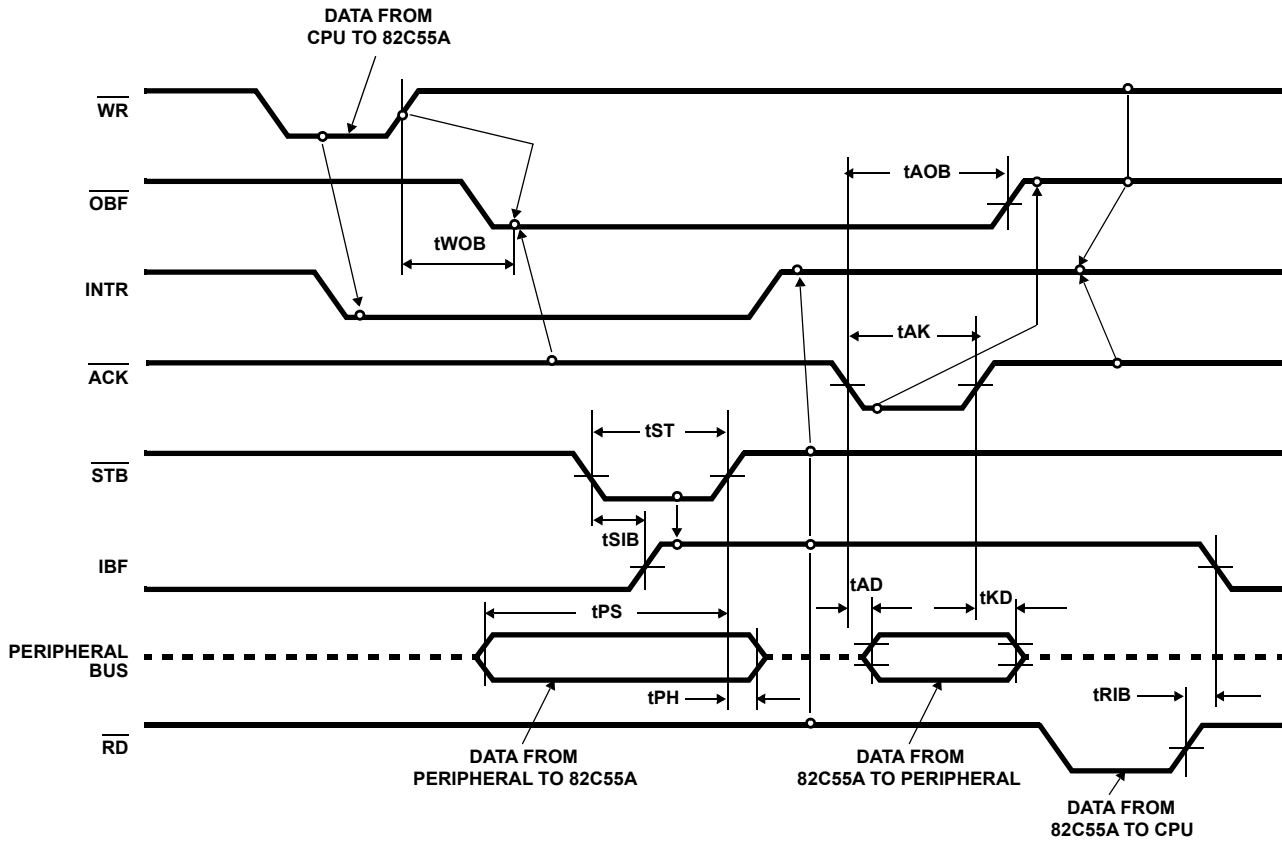

FIGURE 12. MODE 2

NOTE: Any sequence where  $\overline{WR}$  occurs before  $\overline{ACK}$  and  $\overline{STB}$  occurs before  $\overline{RD}$  is permissible. ( $INTR = IBF \cdot \overline{MASK} \cdot \overline{STB} \cdot \overline{RD} + \overline{OBF} \cdot \overline{MASK} \cdot \overline{ACK} \cdot \overline{WR}$ )

Special Mode Combination Considerations

There are several combinations of modes possible. For any combination, some or all of Port C lines are used for control or status. The remaining bits are either inputs or outputs as defined by a "Set Mode" command.

During a read of Port C, the state of all the Port C lines, except the ACK and STB lines, will be placed on the data bus. In place of the ACK and STB line states, flag status will appear on the data bus in the PC2, PC4, and PC6 bit positions as illustrated by Figure 17.

Through a "Write Port C" command, only the Port C pins programmed as outputs in a Mode 0 group can be written. No other pins can be affected by a "Write Port C" command, nor can the interrupt enable flags be accessed. To write to any Port C output programmed as an output in Mode 1 group or to change an interrupt enable flag, the "Set/Reset Port C Bit" command must be used.

With a "Set/Reset Port C Bit" command, any Port C line programmed as an output (including IBF and OBF) can be written, or an interrupt enable flag can be either set or reset. Port C lines programmed as inputs, including ACK and STB lines, associated with Port C are not affected by a "Set/Reset Port C Bit" command. Writing to the corresponding Port C bit positions of the ACK and STB lines with the "Set Reset Port C Bit" command will affect the Group A and Group B interrupt enable flags, as illustrated in Figure 17.

FIGURE 15. MODE 1 STATUS WORD FORMAT

FIGURE 16. MODE 2 STATUS WORD FORMAT

Current Drive Capability

Any output on Port A, B or C can sink or source 2.5mA. This feature allows the 82C55A to directly drive Darlington type drivers and high-voltage displays that require such sink or source current.

Reading Port C Status (Figures 15 and 16)

In Mode 0, Port C transfers data to or from the peripheral device. When the 82C55A is programmed to function in Modes

1 or 2, Port C generates or accepts “hand shaking” signals with the peripheral device. Reading the contents of Port C allows the programmer to test or verify the “status” of each peripheral device and change the program flow accordingly.

There is not a special instruction to read the status information from Port C. A normal read operation of Port C is executed to perform this function.

INTERRUPT ENABLE FLAG	POSITION	ALTERNATE PORT C PIN SIGNAL (MODE)
INTE B	PC2	$\overline{ACKB}$ (Output Mode 1) or STBB (Input Mode 1)
INTE A2	PC4	$\overline{STBA}$ (Input Mode 1 or Mode 2)
INTE A1	PC6	$\overline{ACKA}$ (Output Mode 1 or Mode 2)

FIGURE 17. INTERRUPT ENABLE FLAGS IN MODES 1 AND 2

### Applications of the 82C55A

The 82C55A is a very powerful tool for interfacing peripheral equipment to the microcomputer system. It represents the optimum use of available pins and is flexible enough to interface almost any I/O device without the need for additional external logic.

Each peripheral device in a microcomputer system usually has a “service routine” associated with it. The routine manages the software interface between the device and the CPU. The functional definition of the 82C55A is programmed by the I/O service routine and becomes an extension of the system software. By examining the I/O devices interface characteristics for both data transfer and timing, and matching this information to the examples and tables in the detailed operational description, a control word can easily be developed to initialize the 82C55A to exactly “fit” the application. Figures 18 through 24 present a few examples of typical applications of the 82C55A.

SYMBOL	PARAMETER	TEST CONDITIONS	MIN	MAX	UNITS
$V_{IH}$	Logical One Input Voltage		2.0 2.2	-	V
$V_{IL}$	Logical Zero Input Voltage		-	0.8	V
$V_{OH}$	Logical One Output Voltage	$I_{OH} = -2.5\text{mA}$ , $I_{OH} = -100\mu\text{A}$	3.0 $V_{CC}-0.4$	-	V
$V_{OL}$	Logical Zero Output Voltage	$I_{OL} +2.5\text{mA}$	-	0.4	V
$I_I$	Input Leakage Current	$V_{IN} = V_{CC}$ or GND, $\overline{RD}$ , $\overline{CS}$ , A1, A0, RESET, WR	-1.0	+1.0	$\mu\text{A}$
IO	I/O Pin Leakage Current	$V_O = V_{CC}$ or GND, D0 - D7	-10	+10	$\mu\text{A}$
IBHH	Bus Hold High Current	$V_O = 3.0V$ . Ports A, B, C $T_A = -55^\circ\text{C}$	-50	-450	$\mu\text{A}$
		$T_A = +128^\circ\text{C}$	-50	-400	$\mu\text{A}$
IBHL	Bus Hold Low Current	$V_O = 1.0V$ . Port A ONLY $T_A = -55^\circ\text{C}$	50	450	$\mu\text{A}$
		$T_A = +128^\circ\text{C}$	50	400	$\mu\text{A}$
IDAR	Darlington Drive Current	Ports A, B, C. Test Condition 3	-2.5	Note 2, 4	mA
ICCSB	Standby Power Supply Current	$V_{CC} = 5.5V$ , $V_{IN} = V_{CC}$ or GND. Output Open	-	10	$\mu\text{A}$
ICCOP	Operating Power Supply Current	$T_A = +25^\circ\text{C}$ , $V_{CC} = 5.0V$ , Typical (See Note 3)	-	1	mA/MHz

**NOTES:**

- No internal current limiting exists on Port Outputs. A resistor must be added externally to limit the current.
- ICCOP = 1mA/MHz of Peripheral Read/Write cycle time. (Example:  $1.0\mu\text{s}$  I/O Read/Write cycle time = 1mA).
- Tested as  $V_{OH}$  at  $-2.5\text{mA}$ .

**Capacitance**  $T_A = +25^\circ\text{C}$ 

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
CIN	Input Capacitance	10	pF	FREQ = 1MHz, All Measurements are referenced to device GND
CI/O	I/O Capacitance	20	pF	

**AC Electrical Specifications**  $V_{CC} = +5V \pm 10\%$ ,  $GND = 0V$ ;  $T_A$  = Operating Temperature Range

**AC Test Circuit**

NOTE: Includes STRAY and JIG Capacitance

**AC Testing Input, Output Waveforms**

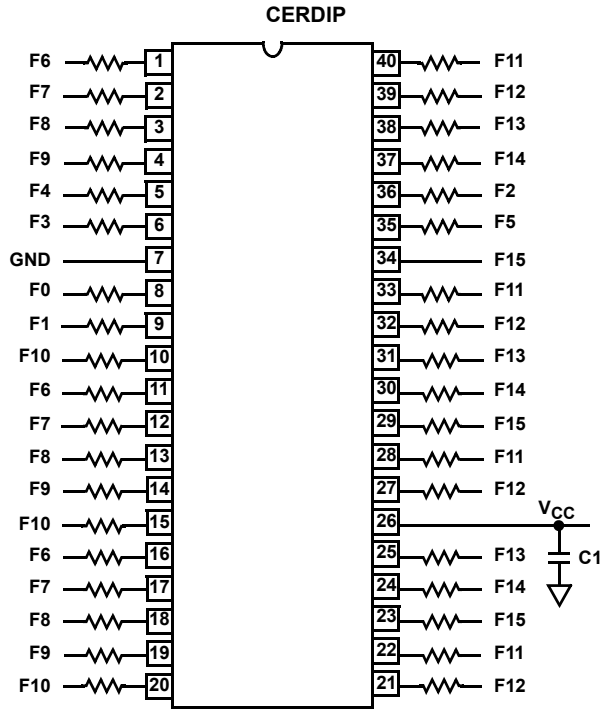

AC Testing: All AC Parameters tested as per test circuits. Input RISE and FALL times are driven at 1ns/V.

TEST CONDITION DEFINITION TABLE

TEST CONDITION	V1	R1	R2	C1
1	1.7V	523Ω	Open	150pF
2	$V_{CC}$	2kΩ	1.7kΩ	50pF
3	1.5V	750Ω	Open	50pF

**Burn-In Circuits**

NOTES:

1.  $V_{CC} = 5.5V \pm 0.5V$
2.  $V_{IH} = 4.5V \pm 10\%$
3.  $V_{IL} = -0.2V$  to  $0.4V$
4.  $GND = 0V$

NOTES:

1.  $C1 = 0.01\mu F$  minimum
2. All resistors are  $47k\Omega \pm 5\%$
3.  $f_0 = 100kHz \pm 10\%$
4.  $f_1 = f_0 \div 2$ ;  $f_2 = f_1 \div 2$ ; ... ;  $f_{15} = f_{14} \div 2$

### Die Characteristics

#### METALLIZATION:

Type: Silicon - Aluminum  
Thickness:  $11\text{k}\text{\AA} \pm 1\text{k}\text{\AA}$

#### GLASSIVATION:

Type:  $\text{SiO}_2$   
Thickness:  $8\text{k}\text{\AA} \pm 1\text{k}\text{\AA}$

### Metallization Mask Layout

L	0.115	0.200	2.93	5.08	4
N	40		40		9

**NOTES:**

- Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
- Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
- D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
- E and e<sub>A</sub> are measured with the leads constrained to be perpendicular to datum -C-.
- e<sub>B</sub> and e<sub>C</sub> are measured at the lead tips with the leads unconstrained. e<sub>C</sub> must be zero or greater.
- B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
- N is the maximum number of terminal positions.
- Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).

**NOTES:**

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark.
2. The maximum limits of lead dimensions b and c or M shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
3. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness.
4. Corner leads (1, N, N/2, and N/2+1) may be configured with a partial lead paddle. For this configuration dimension b3 replaces dimension b2.
5. This dimension allows for off-center lid, meniscus, and glass overrun.
6. Dimension Q shall be measured from the seating plane to the base plane.
7. Measure dimension S1 at all four corners.
8. N is the maximum number of terminal positions.
9. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
10. Controlling dimension: INCH.

NOTES:

1. Metallized castellations shall be connected to plane 1 terminals and extend toward plane 2 across at least two layers of ceramic or completely across all of the ceramic layers to make electrical connection with the optional plane 2 terminals.
2. Unless otherwise specified, a minimum clearance of 0.015 inch (0.38mm) shall be maintained between all metallized features (e.g., lid, castellations, terminals, thermal pads, etc.)
3. Symbol "N" is the maximum number of terminals. Symbols "ND" and "NE" are the number of terminals along the sides of length "D" and "E", respectively.
4. The required plane 1 terminals and optional plane 2 terminals (if used) shall be electrically connected.
5. The corner shape (square, notch, radius, etc.) may vary at the manufacturer's option, from that shown on the drawing.
6. Chip carriers shall be constructed of a minimum of two ceramic layers.
7. Dimension "A" controls the overall package thickness. The maximum "A" dimension is package height before being solder dipped.
8. Dimensioning and tolerancing per ANSI Y14.5M-1982.
9. Controlling dimension: INCH.

NOTES:

1. Controlling dimension: INCH. Converted millimeter dimensions are not necessarily exact.
2. Dimensions and tolerancing per ANSI Y14.5M-1982.
3. Dimensions D1 and E1 do not include mold protrusions. Allowable mold protrusion is 0.010 inch (0.25mm) per side. Dimensions D1 and E1 include mold mismatch and are measured at the extreme material condition at the body parting line.
4. To be measured at seating plane -C- contact point.
5. Centerline to be determined where center leads exit plastic body.
6. "N" is the number of terminal positions.

NOTES:

1. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
2. All dimensions and tolerances per ANSI Y14.5M-1982.
3. Dimensions D and E to be determined at seating plane **-C-**.
4. Dimensions D1 and E1 to be determined at datum plane **-H-**.
5. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25mm (0.010 inch) per side.
6. Dimension b does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total.
7. "N" is the number of terminal positions.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
  2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
  3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
  4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
  5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
    - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
    - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
  6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
  7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
  8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
  9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
  10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
  11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
  12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
- (Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
- (Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
